## Country Overview

### GRENADA

The indigenous Caribs resisted European attempts to colonize Grenada for more than a century after Columbus discovered the island in 1498. The French settled Grenada in the 17th century, but the British finally gained control of the island in 1783. Grenada achieved full independence in 1974. After independence, Grenada adopted a parliamentary system based on the British model, with a governor general representing the British monarch (head of state) and a prime minister who is the head of the government. Prime Minister Gairy was ousted in a 1979 coup organized by the leftist New Jewel Movement and led by Maurice Bishop. In October 1983, a power struggle within the government resulted in the arrest and execution of Bishop, and a few days later a U.S.-Caribbean force landed on Grenada in response to an appeal from the governor general and to a request for assistance from the Organization of Eastern Caribbean States. Free elections were reinstituted the following year and the country has since remained a parliamentary democracy. Grenada has a largely tourism-based, small, open economy. Known as the "Spice Island," it is the world's second-largest producer of nutmeg and a significant producer of mace, cinnamon, ginger and cloves.

## History

Before the arrival of Europeans, Caribs, who had driven away the more peaceful indigenous Arawaks, inhabited Grenada and its neighboring islands.

Christopher Columbus spotted the island in 1498 during his third voyage to the New World, but by most (although not all) accounts did not land there. Whether or not he set foot on the island, he did give it a name-"Concepción," in honor of Mary, the mother of Jesus.

Shortly after Columbus' voyages, other sailors in the Spanish fleet conferred on it the name that eventually stuck, Granada, after the city in Spain, supposedly because the island's verdant landscape reminded them of the hills of Andalusia where the city of Granada is located. The current spelling, Grenada, is a French variant that has been used since the 18<sup>th</sup> century.

Early European attempts to colonize Grenada failed in the face of fierce resistance by the Caribs. No European settlement gained a foothold at all during the 1500s.

In 1609, a group of Britons founded an enclave called Megrin Town, but harassment from the Caribs forced them to abandon it after a short time.

The French often managed to attain a state of coexistence, if not harmony, with the indigenous people of the Americas more successfully than the English, and were able to establish a permanent presence in 1639.

Tensions between the French and the Caribs then escalated, and in 1650, the French settlers defeated the indigenous population in a great battle. In the aftermath of this engagement, many Caribs jumped off a cliff to their death when they realized defeat was certain. The spot where this happened now bears the name "Morne des Sauteurs," or "Leapers' Hill."

Britain captured Grenada in 1762 during the Seven Years' War, and France formally ceded the island to England in the 1763 Treaty of Paris that ended this conflict. However, French forces regained control briefly, from 1779 to 1783. That year, in the Treaty of Versailles that ended the American Revolution, the island was restored to Britain. It remained British for the rest of the colonial era.

Grenada's one major slave revolt, led in 1795 by a free black man named Julian Fedon, happened early in the period of British rule. The rebellion was initially successful, but British reinforcements arrived shortly to crush it. A mountain stronghold, where Fedon and his cohorts put up their final fight, is today a popular tourist attraction, though its panoramic view is probably a greater draw than its historic significance.

Even as this rebellion played out in the late 18<sup>th</sup> century, Grenada was undergoing an important transition that was eroding the paramount role of sugar cane in its economy. As in much of the West Indies, Europeans originally settled the island with the purpose of cultivating sugar on extensive estates using African slave labor. A series of natural disasters that ruined most of the sugar crop, however, paved the way for the introduction of what proved very effective agricultural alternatives..

In 1782, Sir Joseph Banks, the botanical adviser to King George III, introduced nutmeg to Grenada. The island's soil was ideal for growing the spice, and, because Grenada was a closer source of spices for Europe than the Dutch East Indies, the island assumed a new importance to European traders. Spice cultivation expanded to encompass a variety of products in addition to nutmeg, and cocoa eventually became part of the mix, as well.

This development encouraged the growth of a land-owning yeoman farmer class, and correspondingly diminished the importance of the large sugar estates. The lesser importance of large slave-holding plantations on Grenada, by comparison to many other Caribbean islands, probably contributed to a peaceful transition at the time of emancipation, which by parliamentary mandate took place throughout the British Empire at the beginning of 1834. During this period, Grenada was incorporated into the British Windward Islands Administration, and was governed on this basis until independence.

Grenada was part of the Federation of the West Indies from this entity's formation in 1958 until its collapse in 1962. The federation represented Britain's original de-colonization scheme for its West Indies territories: ten separate island colonies were to be combined into one administrative unit, and be granted independence as one amalgamated new nation. The concept generated considerable resistance in the region, as many of those affected by the plan felt that the islands' geographic separation and cultural differences precluded joining them as a viable unitary country.

A referendum in which Jamaica, the most populous British Caribbean island, opted to leave the federation and pursue national sovereignty on its own precipitated the final dissolution of the whole grouping. At that point, the larger island colonies, such as Trinidad and Tobago, proceeded on a path to separate independence and the smaller ones, including Grenada, reverted to dependency status.

In 1967, Grenada received full internal autonomy as an associate state of Great Britain; foreign policy remained set in London. Grenada, under the charismatic but erratic leadership of then-Premier Eric Gairy, became the first British Windward Island associated state to seek full independence. This was granted on Feb. 7, 1974, whereupon Gairy became the country's first prime minister.

## Political Conditions

Grenadian politics, during the period of associated statehood and the early post-independence era, was largely a contest for power between Gairy's Grenada United Labour Party, or GULP, and the Grenada National Party, or GNP, led by Herbert Blaize.

Gairy was an outspoken populist who consistently retained the loyalty of many poorer Grenadians, but he also displayed an authoritarian streak that, in the view of some analysts, made some aspects of his tenure akin to Duvalierist rule in Haiti. Although suppression of civil liberties in Grenada never reached remotely near the deadly level seen in Haiti, those expressing opposition to the Gairy government were at times beaten or detained by police.

Various corruption allegations involving government figures also surfaced. Moreover, Gairy grew increasingly eccentric during the time he held office. He developed a fascination for UFOs, and grew convinced such craft have arrived on earth from outer space. Prime Minister Gairy devoted much energy to activities such as requesting release of information on UFOs (which he believed would prove their existence) from the United Nations. Meanwhile, external factors, especially the oil price shock of the late 1970s, drove the Grenadian economy into a precarious condition.

On March 13, 1979, Grenada became the site of the first coup d'etat in an English-speaking, Western Hemisphere country. The coup d'etat, led by Maurice Bishop and his allies in the New Jewel Movement, has often been described as nearly bloodless, but in fact two policemen trying to preserve the Gairy government and one New Jewel rebel died during the brief violence surrounding the unauthorized transition of power.

The new leader, Bishop, advanced a socialist ideology and cultivated warm relations with Fidel Castro's Cuba, which provided Grenada with economic and technical aid. Cuba also proffered

military aid such as small shipments of sidearms, as well as the assistance of military advisers and trainers.

The United States' (U.S.) policy response, during the administration of President Jimmy Carter, was more one of cold aloofness than hot condemnation. The U.S. urged Bishop to schedule elections and thereby return Grenada to democratic rule, but for the most part took a hands-off approach.

Perhaps ironically, some of Bishop's strongest support came from the Grenadian middle class. Bishop implemented various infrastructure and educational initiatives that promised to improve the country's competitiveness, while adhering to a mixed-economy model. After the island's economic stagnation under Gairy, the course taken by the New Jewel government gave many private sector interests hope that the regime change might actually enhance rather than threaten their position.

When Ronald Reagan took office as U.S. president in 1981, one of the highest-profile policy shifts was a new emphasis on combating the putative export of the Marxist revolution from the Soviet Union and its client, Cuba, to new locations in Latin America and the Caribbean.

U.S. government spokespersons pointed to Cuban assistance in the construction of a large new international airport in Grenada. Although the Grenadian government asserted that the airport was simply part of a strategy to advance the island's most viable industry, tourism, the Reagan administration contended that such a big facility could only be consistent with plans for military use. A war of words ensued for the next two years between the U.S. and Grenadian governments. Bishop even predicted a U.S. invasion after NATO conducted the largest military exercise the alliance ever staged in the Caribbean. These August 1981 war games at the U.S. military base in Vieques, Puerto Rico had the rather transparent code name "Amber and the Amberdines."

On Oct. 18, 1983, a far-left faction of the New Jewel government led by Deputy Prime Minister Bernard Coard and General Hudson Austin seized power, killing Bishop and five other members of his government. The circumstances of this event remain mysterious. Apparently, the plotters of the second coup d'etat believed that Bishop was too moderate and conciliatory toward Western capitalism. Neither Cuban operatives nor other agent provocateurs put them up to the task, as far as can be determined by the available evidence; rather, the overthrow and murder of Bishop seem to have been an independent action of the Coard-Hudson group.

About one-third of Grenada's population massed in the capital, St. George's, protesting the new leadership and, especially, the killing of the charismatic Bishop. A military detachment, supporting Coard, fired into the crowd, killing an estimated 40 people.

Amid these signs of a serious breakdown in civil order, U.S. officials raised concerns for the safety of American students at a medical school in St. George's. The need to protect the students was the

most-cited cause for an invasion of the island by U.S. and Caribbean regional forces on Oct. 25, one week after the coup d'etat which eliminated Bishop.

The U.S. sought approval for this action from the Organization of Eastern Caribbean States, which the OECS gave, but not unanimously. The governor general of Grenada made a separate request for military intervention.

About 7,000 U.S. troops landed on the island, accompanied by a regional military contingent numbering approximately 200. The battle to retake Grenada from the Coard-Hudson faction and several hundred Cubans-mostly construction workers assigned to the airport project, but including a corps of military advisers-last-ed three days. A widely recounted casualty list enumerates 70 Cubans, 42 Americans, and 170 Grenadians killed during the engagement. Among the Grenadian deaths were 18 patients at a mental hospital mistakenly attacked by U.S. forces.

After order was restored, an advisory council named by Grenada's governor general administered the country until general elections were held in December 1984. The New National Party (NNP), led by Herbert Blaize, who had served as premier during Grenada's period of partial autonomy prior to independence, won this vote overwhelmingly, taking 14 of the 15 parliamentary seats. Eric Gairy, the prime minister ousted in 1979 - who had been out of the country pursuing his UFO research when the coup d'etat took place - returned to Grenada and attempted to reorganize his Grenada United Labour Party (GULP), but the party never regained the degree of adherence it had earlier enjoyed.

Grenada's constitution, which had been suspended in 1979 by the New Jewel government under Maurice Bishop, was restored after the 1984 elections. Most of the military intervention forces departed the island within months, though a small remnant remained for several years.

Herbert Blaize's New National Party (NNP) held power until 1989. Its majority was reduced during 1986-87, when five NNP parliamentarians, including two cabinet ministers, left the party and formed the National Democratic Congress, or NDC, which became the official opposition.

In August 1989, Prime Minister Blaize himself broke with the NNP to form another new party, the Grenada National Party, or GNP. This split gave Grenada a minority government as the country approached the next general election, scheduled for March 1990. Prime Minister Blaize did not live to see this vote: he died in office in December 1989 and was succeeded as prime minister and head of government by Ben Jones.

The NDC emerged from the 1990 elections as the strongest party, winning seven of the fifteen available seats. The NDC leader, Nicholas Brathwaite, became prime minister of a coalition government by adding two GNP members and one Grenada United Labour Party (GULP) member, giving the government ten seats in parliament against the opposition's five. However, the

results of the next general election, in 1995, swung the balance of power back to the NNP.

After the 1995 parliamentary elections, Grenada was then governed by the free market-oriented New National Party under Prime Minister Keith Mitchell. Still, the NNP's success did not indicate virtual unanimity of political opinion as it superficially suggests.

Indeed, since the mid-1990s, Grenada has experienced a sequence of defections from the government and reshufflings among opposition figures that resulted in new umbrella groups attempting to claim the mantle of the opposition leadership.

A former deputy leader of the NDC, Francis Alexis, together with some supporters, formed a new group called the Democratic Labour Party, or DLP, in 1995, shortly after that year's election. In May 1997, the DLP joined forces with all the established opposition parties - the NDC, GNP, GULP and a fourth party - in an attempt to cobble together a united opposition front. Within weeks, the creation of yet another party - the Grenada Progressive Party, or GPP, headed by Prescott Williams - precluded that possibility.

While opposition unity proved elusive, in late 1998 government opponents forced Keith Mitchell's administration to call a new election 18 months before the constitutionally mandated deadline. During the run-up to this vote, charges circulated that Prime Minister Mitchell and members of his government had engaged in a variety of corrupt practices involving foreign investment in Grenada and infrastructure project contracts.

Despite this negative publicity, however, the election, held in January 1999, swept Mitchell and the ruling NNP back into power. The NNP obtained over 62 percent of the total votes cast and winning all the 15 seats to the Senate. This nearly doubled its previous tally which was eight in the outgoing parliament.

The new government, still under Prime Minister Mitchell, announced that it would focus on education, increased emphasis and use of high technology, poverty reduction, and national unification and development. In early 2000, a millennial proclamation on education set a target of raising the island's literacy rate. An additional goal articulated at this time was an increase, to 70 percent, in the proportion of secondary school graduates who advance to university education.

In October 1999, 17 people serving life sentences for the murders of revolutionary leader Maurice Bishop and other members of his government issued a statement of responsibility and apology for their action. In December 1999, a group called the "Free the 17 Committee" began circulating material calling for the 17 individuals to be released. The identity of the prisoners' advocacy group was obscure, as their urgings had been publicized only through pamphlets and, recently, on the Internet. One of the convicted conspirators, Phyllis Coard, wife of the leader of the 1983 counter coup, was granted a humanitarian furlough to leave the country for cancer treatment.

In a related matter, in January 2000, a St. George's funeral company announced that it had found human remains in United States Army body bags that might be those of assassinated leader Maurice Bishop and his supporters. Whether a forensic examination of this find to make a determination of identity was conducted, and if so, what the results were, remained uncertain.

In general, Grenada has made reasonably good progress in advancing its tourism industry. A similarly favorable evaluation, however, does not apply to its still-important agricultural sector. Although the island's diversified farm production should, in theory, insulate it to some degree from adverse market trends, that theory carries less weight insofar as prices for most commodities have declined. The major export crop of nutmeg has been a source of particular concern. Grenada is the world's second-largest grower of nutmeg, but it trails far behind the top grower, Indonesia. In 1993, the two countries agreed to destroy 700 tons of the spice to curtail oversupply and boost prices. The tendency for production to outrun demand soon reasserted itself, however.

The year 1999 was a comparatively good one for Grenada's economy in no small part due to political turmoil seriously disrupting Indonesian nutmeg production and shipments that year. Indonesia's struggle to recover presaged a significant expansion in its nutmeg output, which did not bode well for the Grenadian nutmeg industry.

The year 2000 saw some episodes of labor unrest in Grenada's still largely public sector-dominated economy. Employees of the national broadcasting company went on strike, and utility workers and others delivering essential public services eventually called a solidarity strike in support of the broadcast union. The government gave in to most of the broadcast workers' demands in order to avert a crippling situation, after power, water and sewer services, as well as port activity, were briefly affected by the shutdown.

Also in mid-2000, teachers staged a three-week "sick out" that prevented the schools from functioning normally although they stayed open. The teachers then escalated the action to a full-blown strike that lasted two days before the government reached an agreement with their union. The settlement provided a retroactive pay increase as far back as 1996 for some teachers, but it was effectual only through the end of 2001, so a recurrent confrontation over teachers' pay was predicted to arise in the near future.

The prospects for further labor unrest rose yet again in early 2001 when parliament voted itself an 18 percent raise, prompting a widespread assessment that most other sectors of the economy would respond by seeking on a similar raise on their own behalf.

Meanwhile, Prime Minister Keith Mitchell's former minister of agriculture, Michael Baptiste, who was appointed to the cabinet following the 1995 election, became embroiled in increasing acrimony with the prime minister and the rest of the government. In 1999, just before the last election,

Baptiste's cabinet portfolio was revoked and he was demoted to the post of a "back bench" junior minister. Baptiste stepped up his criticism of the government, and in June 2000, Prime Minister Mitchell sacked Baptiste.

His dismissal meant that the ruling New National Party no longer controlled every seat in the parliament, and Baptiste assumed the role of opposition leader. Baptiste established contacts with the People's Republic of China, seeking both general economic aid for Grenada and funds on behalf of his oppositionist politicking. The Chinese contacts defied the government's policy of close ties to Taiwan, and in September 2000 the government expelled three Chinese diplomats that Baptiste had invited to Grenada. Baptiste later brought together the surviving remnants of the Gairy party GULP. As such, anti-government elements took over the leadership of a renovated GULP.

Mitchell's political troubles did not end with the sacking of Baptiste. Soon afterwards, Mitchell had to face another revolt. This time from another cabinet minister, Mark Isaac, who did not agree with Mitchell's policy of developing close ties with Libya. Although he was reinstated later, as a junior minister for Information, Isaac was told he could not contest the next parliamentary elections in the country, slated for December 2004.

The country's offshore banking sector has been another source of controversy during the past year. Problems include Grenada's listing as a tax haven by the Organization for Economic Cooperation and Development, a body of the world's 30 industrialized nations; the collapse of the country's largest offshore bank, First International; and the suspension of several other banks' licenses pending a probe into financial irregularities. A former governor general of Grenada, Sir Paul Scoon, is a director of one of the banks whose practices have been called into question.

A possible increase in power prices threatened to balloon into yet another controversy as Prime Minister Keith Mitchell said that the Grenada Electricity Services Ltd. had approached him for an increase in prices. However, the company chairman denied the allegations. The issue was then joined by the opposition parties that saw an opportunity to stir up a political storm on the issue.

The opposition also asked the government to scrap the Economic Citizenship Program introduced by Prime Minister Mitchell following his victory at the polls in 1995. The opposition members cited the lack of adequate security mechanisms in Grenada as a reason for suspending the program which basically involves sale of Grenada citizenship to rich investors. Baptiste said that the security of the island was vulnerable and that there were no proper systems in place to monitor those persons who had purchased passports under the program. The opposition also asked the government to release the names of foreign nationals who have been issued Economic Citizenship since the establishment of the program almost six years ago.

In mid-August 2001, the police turned back a demonstration in the capital St. George by nutmeg

workers seeking higher pay. The opposition parties criticized the police action as being too harsh and called it 'a declaration of war.' The opposition alleged that prime minister Mitchell, who also holds the portfolio of National Security was himself responsible for the strong action taken by the police. The workers were seeking an increase of \$2.50 in their daily wages, for which they had been negotiating for over a year.

By 2002, the Mitchell government began exploring opportunities for foreign investment in Grenada. Speaking to a group of entrepreneurs from neighboring Trinidad and Tobago, the Prime Minister noted that Grenada was home to investment opportunities in a variety of areas such as hotel development, Internet Communications Technology (ICT), agriculture, yacht services and marinas, housing for all income levels and private medical services. Mitchell observed that in the last few years, his administration had worked hard to improve Grenada's infrastructure and to create a favorable climate for overseas investments. He indicated that there had been notable improvements in the road system, basic utilities, and progress had been made to develop a new cruise ship berthing area, as well as shopping and commercial facilities. He also stated that the political climate in Grenada was stable, productivity was improved, wages were competitive and bureaucracy had been reduced.

In 2003, Grenada's opposition leader Michael Baptiste accused the Mitchell administration of misappropriating public funds. Baptiste, however, found himself in court to answer charges of financial impropriety from the period of 1997 to 1999 when he was the country's Agriculture Minister. He asserted his own innocence and promised to use his court appearance to expound upon his allegations against the current government.

Meanwhile, the acting Minister of Legal Affairs, Lawrence Joseph said that Baptiste's comments were not a concern for the government. As well, Prime Minister Keith Mitchell declined to comment on the matter of the charges against Baptiste but said that the court system would have to run its course.

On October 19, the last day of his party's national convention, Prime Minister Keith Mitchell announced that general elections would be held on Nov. 27, 2003. His announcement indicated that parliamentary elections would be held nine months earlier than anticipated. The prime minister expressed confidence about his party's prospects while citing its record on infrastructure development. The opposition, however, criticized the government's management of the economy.

In November 2003, Prime Minister Keith Mitchell narrowly won a third term in office garnering one seat more than the major opposition party, National Democratic Congress. Precise results of the election to the House of Representatives were as follows: New National Party (NNP) received 49.9 percent and eight seats; National Democratic Congress (NDC) took 45.1 percent and seven seats; Grenada United Labour Party (GULP) secured 3.2 percent and no seats; while People Labour Movement (PLM) acquired 2.2 percent and no seats.

In September 2004, Hurricane Ivan savaged Grenada, leaving scores dead and over two-thirds of the entire population homeless. Meanwhile up to 90 percent of all buildings were damaged in some way. Included in the destruction was the headquarters for the Red Cross as well as the prison. Although some prisoners attempted to flee, one prisoner who had been jailed for his orchestration of the coup d'etat in the 1980s -- Bernard Coard -- remained put saying that he wished to appeal his conviction in a court of law.

Although Ivan was a natural disaster more than a political event, the effects on Grenada's traumatized society, the national economy and, indeed, the political environment, was expected to be monumental. Other Caribbean nations provided military, financial and humanitarian assistance toward Grenada's reconstruction efforts.

Before Grenada could fully recover from Ivan, in 2005, Hurricane Emily hit the island nation. The hurricane destroyed agricultural crops and damaged many homes, effectively exacerbating the ongoing reconstruction efforts there.

Also in 2005, a report on HIV/AIDS by the United Nations offered cautious optimism to the countries of the Caribbean. The report's findings showed that HIV/AIDS infection rates had increased across the world, with the exception of some Caribbean countries. In the Caribbean, there was a decrease in the prevalence of HIV/AIDS, which was attributed to increased condom use among sex workers and the expansion of voluntary testing and counselling.

The Trinidad-based Caribbean Court of Justice (CCJ) was inaugurated in 2005. This body was intended to settle regional trade disputes within the Caribbean member countries of the regional trade bloc known as CARICOM, and also to ultimately serve as the new final court of appeal for the subscribing member countries, replacing the Privy Council. Presumably, one salient outcome of the change would be to facilitate and legally authorize application of the death penalty. However, the road toward making the CCJ the final appellate court of the Caribbean was expected to be long and fraught with obstacles due to constitutional provisions that would not easily accommodate such a change.

The year 2006 was also marked by the issue of jurisprudence, a year after the CCJ came into being. At issue in mid-2006 was the matter of capital punishment. Specifically, Barbadian authorities were hoping that the CCJ would overturn a ruling by the Privy Council regarding the sentences for two men convicted of murder in 1999, essentially allowing the two men to be hanged for their crime. The Barbadian government's position has been shared by counterparts in other Caribbean countries, most of whom have taken a hard-line stance in response to the problem of rising crime. Nevertheless, it has been surmised that the CCJ may not be inclined to set a new precedent so soon after its inception. Instead, justices may well adhere to the principle of

"jurisprudence constante," in which the stability of court rulings is preserved.

In March 2008, Prime Minister Dr. Keith Mitchell suggested that he would soon announce the date for the general election. Mitchell and the ruling New National Party (NNP) were set to pursue an unprecedented fourth consecutive term in office. As of early 2008, Mitchell's NNP controlled eight of the 15 seats in the parliament.

It was subsequently announced that a parliamentary election would be held in Grenada on July 8, 2008. The parties in contention were: The New National Party, the National Democratic Congress, the Grenada United Labour Party, the People's Labour Movement, Grenada National Party, the Maurice Bishop Patriotic Movement, the New Jewel Movement and others.

In a country where the tension between the two leading parties was high, the Grenada parliamentary election was set to take place despite a climate of dissonance.

Conflicts have arisen between the New National Party and the National Democratic Congress amid the pre-election preparations. Supporters of both parties have succumbed to threatening violence, assault and harassment at times when they have encountered followers of the opposing party while wearing party colors. Prime Minister Keith Mitchell remarked "Candidates, whether we like them or not, have a right to be candidates and to invite people to vote for them."

In the election in November 2008, the New National Party won 8 seats in the House of Representatives and the National Democratic Congress won 7. Representatives are elected to a 5-year term.

Opinion polls showed that the New National Party, led by Prime Minister Mitchell, was leading the National Democratic Congress ahead of the upcoming election. Should the polls prove to be correct, Mitchell's NNP was likely to secure a record fourth straight term in government.

The opinion polls proved to be incorrect in the case of Grenada. After the polls closed and the votes were counted, it was clear that the ruling New National Party of Prime Minister Mitchell was going down to defeat. In this way, Mitchell was denied the unprecedented fourth consecutive term in office that he had hoped to achieve. With 15 parliamentary seats at stake, the opposition National Democratic Congress took an early lead, showing advantages at several key constituencies. This trend proved sustainable as the election night wore on with the opposition party looking poised to carry between nine and 11 seats, which would constitute a clear and decisive victory.

Supporters of the National Democratic Congress took to the streets to celebrate their victory. The party's leader, Tillman Thomas, who had been imprisoned by the People's Revolutionary Government in 1981, characterized the election result as a "great achievement." Meanwhile,

Mitchell appeared to concede defeat and was reported to have called Thomas to congratulate him on winning the election.

The election, which was observed by the Organization of American States, and deemed to be both free and fair, also enjoyed high voter turnout with between 75-80 percent of the electorate casting ballots.

Parliamentary elections were set to be held on Feb. 19, 2013, in Grenada. At stake would be the 15 seats in the House of Representatives where members are elected by popular vote to serve five-year terms representing single-seat districts. The leader of the party able to maintain a majority in the House of Representatives would become prime minister and form a government. The main parties contesting the elections would be Prime Minister Tillman Thomas' ruling National Democratic Congress (NDC), the main opposition New National Party (NNP), the Grenada United Labour Party (GULP), and the recently formed National United Front (NUF).

Note that in mid-February 2013, officials from the NDC claimed that Prime Minister Tillman Thomas survived a coup by deciding to prorogue parliament in September 2012. At a meeting of the NDC, honorary executive member Faye Thompson said: "We had to prorogue the parliament because they were about to stage a coup." The individuals involved in this apparent coup were not identified although Thompson claimed that the former tourism minister, Peter David, who was later expelled from the party, was involved in a plot to remove Thomas from office. It was not known if this disclosure could be verified or would have an impact on the voting intentions of the Grenadian citizenry.

On election day, voters in Grenada went to the polls and cast their ballots. When the polling stations closed and the votes were counted, Tillman Thomas' NDC went down to defeat with Dr. Keith Mitchell's NNP sweeping to convincing victory. Indeed, the NNP managed to win all 15 seats at stake. Mitchell -- a mathematician who served as prime minister for more than a dozen years in the late 1990s and most of the next decade -- was set to return to power. To that end, on Feb. 20, 2013, Mitchell was sworn in as the new prime minister of Grenada and promised to make good on his campaign commitments, and also to unite the country after the acrimonious feelings that surfaced during the pre-election campaign period. Mitchell also subsequently said that he had received advice from local and international leaders on how to deal with the scenario of having no opposition in the parliament of a democratic country.

Cecile La Grenade became the new governor-general and head of state (representing Queen Elizabeth II, the monarch of the United Kingdom and head of the Commonwealth) on May 7, 2013, succeeding Governor General Carlyle Arnold Glean.

\*\*\* Note that the next elections in Grenada were expected to be held in 2018. \*\*\*

## Political Risk Index

### Political Risk Index

The **Political Risk Index** is a proprietary index measuring the level of risk posed to governments, corporations, and investors, based on a myriad of political and economic factors. The [Political Risk Index](#) is calculated using an established methodology by CountryWatch's Editor-in-Chief and is based on varied criteria\* including the following consideration: political stability, political representation, democratic accountability, freedom of expression, security and crime, risk of conflict, human development, jurisprudence and regulatory transparency, economic risk, foreign investment considerations, possibility of sovereign default, and corruption. Scores are assigned from 0-10 using the aforementioned criteria. A score of 0 marks the highest political risk, while a score of 10 marks the lowest political risk. Stated differently, countries with the lowest scores pose the greatest political risk. A score of 0 marks the most dire level of political risk and an ultimate nadir, while a score of 10 marks the lowest possible level of political risk, according to this proprietary index. Rarely will there be scores of 0 or 10 due to the reality that countries contain complex landscapes; as such, the index offers a range of possibilities ranging from lesser to greater risk.

#### \*Methodology

The [Political Risk Index](#) is calculated by CountryWatch's Editor-in-Chief and is based on the combined scoring of varied criteria as follows --

1. political stability (record of peaceful transitions of power, ability of government to stay in office and carry out policies as a result of productive executive-legislative relationship, perhaps with popular support vis a vis risk of government collapse)
2. political representation (right of suffrage, free and fair elections, multi-party participation, and influence of foreign powers)
3. democratic accountability (record of respect for political rights, human rights, and civil liberties, backed by constitutional protections)
4. freedom of expression (media freedom and freedom of expression, right to dissent or express political opposition, backed by constitutional protections)
5. security and crime (the degree to which a country has security mechanisms that ensures safety of citizens and ensures law and order, without resorting to extra-judicial measures)
6. risk of conflict (the presence of conflict; record of coups or civil disturbances; threat of war; threats posed by internal or external tensions; threat or record of terrorism or insurgencies)
7. human development (quality of life; access to education; socio-economic conditions; systemic concern for the status of women and children)
8. jurisprudence and regulatory transparency (the impartiality of the legal system, the degree of transparency within the regulatory system of a country and the durability of that structure)
9. economic conditions (economic stability, investment climate, degree of nationalization of industries, property rights, labor force development)
10. corruption ( the degree of corruption in a country and/or efforts by the government to address graft and other irregularities)

Editor's Note:

As of 2015, the current climate of upheaval internationally -- both politically and economically -- has affected the ratings for several countries across the world.

North Korea, [Afghanistan](#), [Somalia](#), and [Zimbabwe](#) -- retain their low rankings.

Several Middle Eastern and North African countries, such as [Tunisia](#), [Egypt](#), [Libya](#), [Syria](#), [Iraq](#) and [Yemen](#) were downgraded in recent years due to political instability occurring in the "season of

unrest" sweeping the region since 2011 and continuing today. The worst downgrades affected [Syria](#) where civil war is at play, along with the rampage of terror being carried out by Islamist terrorists who have also seized control over part of Syrian territory. [Iraq](#) has been further downgraded due to the rampage of Islamist terrorists and their takeover of wide swaths of Iraqi territory. [Libya](#) has also been downgraded further due to its slippage into failed state status; at issue in [Libya](#) have been an ongoing power struggle between rival militias. [Yemen](#) continues to hold steady with a poor ranking due to continued unrest at the hands of Houthi rebels, secessionists, al-Qaida in the Arabian Peninsula, and Islamic State. Its landscape has been further complicated by the fact that it is now the site of a proxy war between [Iran](#) and [Saudi Arabia](#). Conversely, [Tunisia](#) and [Egypt](#) have seen slight upgrades as these countries stabilize.

In Africa, [Zimbabwe](#) continues to be one of the bleak spots of the world with the Mugabe regime effectively destroying the country's once vibrant economy, and miring [Zimbabwe](#) with an exceedingly high rate of inflation, debilitating unemployment, devolving public services, and critical food shortages; rampant crime and political oppression round out the landscape. [Somalia](#) also sports a poor ranking due to the continuing influence of the terror group, al-Shabab, which was not operating across the border in [Kenya](#). On the upside, [Nigeria](#), which was ineffectively dealing with the threat posed by the terror group, Boko Haram, was making some strides on the national security front with its new president at the helm. [Mali](#) was slightly upgraded due to its efforts to return to constitutional order following the 2012 coup and to neutralize the threat of separatists and Islamists. But the [Central African Republic](#) was downgraded due to the takeover of the government by Muslim Seleka rebels and a continued state of lawlessness in that country. South [Sudan](#) -- the world's newest nation state -- has not been officially included in this assessment; however, it can be unofficially assessed to be in the vicinity of "3" due to its manifold political and economic challenges. [Burkina Faso](#), [Burundi](#) and [Guinea](#) have been downgraded due to political unrest, with [Guinea](#) also having to deal with the burgeoning Ebola crisis.

In Europe, [Ukraine](#) was downgraded due to the unrest facing that country following its Maidan revolution that triggered a pro-Russian uprising in the eastern part of the country. [Russia](#) was also implicated in the Ukrainian crisis due to its intervention on behalf of pro-Russian separatists, as well as its annexation of the Ukrainian territory of Crimea. Strains on the infrastructure of southern and eastern European countries, such as [Serbia](#), [Croatia](#), and [Hungary](#), due to an influx of refugees was expected to pose social and economic challenges, and slight downgrades were made accordingly. So too, a corruption crisis for the Romanian prime minister has affected the ranking of that country. Meanwhile, the rankings for [Spain](#), [Portugal](#), [Ireland](#), and [Italy](#) were maintained due to debt woes and the concomitant effect on the euro zone. [Greece](#), another euro zone nation, was earlier downgraded due to its sovereign debt crisis; however, no further downgrade was added since the country was able to successfully forge a bailout rescue deal with creditor institutions. Cyprus' exposure to Greek banks yielded a downgrade in its case.

In Asia, [Nepal](#) was downgraded in response to continuous political instability and a constitutional

crisis that prevails well after landmark elections were held. Both [India](#) and China retain their rankings; [India](#) holds a slightly higher ranking than [China](#) due to its record of democratic representation and accountability. Increasing violence and political instability in [Pakistan](#) resulted in a downgrade for this country's already low rating. Meanwhile, [Singapore](#) retained its strong rankings due to its continued effective stewardship of the economy and political stability.

In the Americas, ongoing political and economic woes, as well as crime and corruption have affected the rankings for [Mexico](#), [Guatemala](#), and [Brazil](#). [Argentina](#) was downgraded due to its default on debt following the failure of talks with bond holders. [Venezuela](#) was downgraded due to its mix of market unfriendly policies and political oppression. For the moment, the [United States](#) maintains a strong ranking along with [Canada](#), and most of the English-speaking countries of the Caribbean; however, a renewed debt ceiling crisis could cause the [United States](#) to be downgraded in a future edition. Finally, a small but significant upgrade was attributed to [Cuba](#) due to its recent pro-business reforms and its normalization of ties with the United States.

## Political Stability

### Political Stability

The **Political Stability Index** is a proprietary index measuring a country's level of stability, standard of good governance, record of constitutional order, respect for human rights, and overall strength of democracy. The [Political Stability](#) Index is calculated using an established methodology\* by CountryWatch's Editor-in-Chief and is based on a given country's record of peaceful transitions of power, ability of a government to stay in office and carry out its policies vis a vis risk credible risks of government collapse. Threats include coups, domestic violence and instability, terrorism, etc. This index measures the dynamic between the quality of a country's government and the threats that can compromise and undermine stability. Scores are assigned from 0-10 using the aforementioned criteria. A score of 0 marks the lowest level of political stability and an

ultimate nadir, while a score of 10 marks the highest level of political stability possible, according to this proprietary index. Rarely will there be scores of 0 or 10 due to the reality that countries contain complex landscapes; as such, the index offers a range of possibilities ranging from lesser to greater stability.

### \*Methodology

The Political Stability Index is calculated by CountryWatch's Editor-in-Chief and is based on the combined scoring of varied criteria as follows --

1. record of peaceful transitions of power ( free and fair elections; adherence to political accords)
2. record of democratic representation, presence of instruments of democracy; systemic accountability
3. respect for human rights; respect for civil rights
4. strength of the system of jurisprudence, adherence to constitutional order, and good governance
5. ability of a government to stay in office and carry out its policies vis a vis risk credible risks of government collapse (i.e. government stability versus a country being deemed "ungovernable")
6. threat of coups, insurgencies, and insurrection
7. level of unchecked crime and corruption
8. risk of terrorism and other threats to national security
9. relationship with regional powers and international community; record of bilateral or multilateral cooperation
10. degree of economic strife (i.e. economic and financial challenges)

### Editor's Note:

As of 2015, the current climate of upheaval internationally -- both politically and economically --

has affected the ratings for several countries across the world. The usual suspects -- North Korea, [Afghanistan](#), and [Somalia](#) -- retain their low rankings. The reclusive and ultra-dictatorial North Korean regime, which has terrified the world with its nuclear threats, has exhibited internal instability. Of note was a cut-throat purge of hundreds of high ranking officials deemed to be a threat to Kim Jung-un. Despite their attempts to recover from years of lawlessness, war, and warlordism, both [Afghanistan](#) and [Somalia](#) continue to be beset by terrorism and turmoil. In [Afghanistan](#), while international forces have seen success in the effort against the terror group, al-Qaida, the other Islamist extremist group, the Taliban, continues to carry out a vicious insurgency using terrorism. In [Somalia](#), while the government attempts to do the nation's business, the terror group, al-Shabab continues to make its presence known not only in [Somalia](#), but across the border into [Kenya](#) with devastating results/ Also in this category is [Iraq](#), which continues to be rocked by horrific violence and terrorism at the hands of Islamic State, which has taken over wide swaths of Iraqi territory.

Syria, [Libya](#), and [Yemen](#) have been added to this unfortunate echelon of the world's most politically unstable countries. [Syria](#) has been mired by the twin hazards of 1. a civil war as rebels oppose the Assad regime; and 2. the rampage of terror being carried out by Islamic State, which also seized control over vast portions of Syrian territory. Meanwhile, the post-Qaddhafi landscape of [Libya](#) has devolved into chaos as rival militias battle for control -- the elected government of the country notwithstanding. Rounding out this grim triad is [Yemen](#), which was dealing with a Houthi rebellion, secessionists in the south, as well as the threat of terrorism from al-Qaida in the Arabian Peninsula as well as Islamic State, while also being the site of a proxy war between Shi'a [Iran](#) and Sunni [Saudi Arabia](#).

Meanwhile, several Middle Eastern and North African countries, such as [Tunisia](#), [Egypt](#), and [Bahrain](#) were downgraded in recent years due to political instability occurring in the "season of unrest" sweeping the region since 2011 and continuing today. All three of these countries have stabilized in recent years and have been upgraded accordingly. In [Bahrain](#), the landscape had calmed. In [Egypt](#), the secular military-backed government has generated criticism for its crackdown on the Muslim Brotherhood; however, the country had ratified the presidency via democratic elections and were on track to hold parliamentary elections as the country moved along the path of democratization. Perhaps the most impressive story was coming out of [Tunisia](#) -- the country whose Jasmine Revolution sparked the entire Arab Spring -- and where after a few years of strife, a new progressive constitution was passed into law and a secular government had been elected to power. [Tunisia](#), [Egypt](#), and [Bahrain](#) have seen slight upgrades as these countries stabilize.

In Africa, the [Central African Republic](#) was downgraded the previous year due to the takeover of the government by Muslim Seleka rebels. Although the country has been trying to emerge from this crisis, the fact of the matter was that it was difficult to halt the precipitous decline into lawlessness in that country. [Zimbabwe](#) has maintained its consistently poor ranking due to the

dictatorial regime of Mugabe, who continues to hold a tight grip on power, intimidates the opposition, squashes dissent, and oppresses the white farmer population of the country. Moving in a slightly improved direction is [Nigeria](#), which has sported abysmal ratings due to the government's fecklessness in dealing with the threat posed by the Islamist terror group, Boko Haram. Under its newly-elected government, there appears to be more of a concerted effort to make national security a priority action item. [Mali](#) was also slightly upgraded due to its efforts to return to constitutional order following the 2012 coup and to neutralize the threat of separatists and Islamists. Political instability has visited [Burkina Faso](#) and [Burundi](#) as the leaders of those countries attempted to side-step constitutional limits to hold onto power. In [Burundi](#), an attempted coup ensued but quelled, and the president won a (questionable) new term in office; unrest has since punctuated the landscape. In [Burkina Faso](#), the political climate has turned stormy as a result of a successful coup that ended the rule of the president, and then a putsch against the transitional government. These two African countries have been downgraded as a result.

It should be noted that the African country of South [Sudan](#) -- the world's newest nation state -- has not been officially included in this assessment; however, it can be unofficially assessed to be in the vicinity of "3" due to its manifold political and economic challenges. [Guinea](#) has endured poor rankings throughout, but was slightly downgraded further over fears of social unrest and the Ebola heath crisis.

In Europe, [Ukraine](#) was downgraded due to the unrest facing that country following its Maidan revolution that triggered a pro-Russian uprising in the eastern part of the country. [Russia](#) was also implicated in the Ukrainian crisis due to its intervention on behalf of pro-Russian separatists, as well as its annexation of the Ukrainian territory of Crimea. [Serbia](#) and [Albania](#) were slightly downgraded due to eruptions of unrest, while [Romania](#) was slightly downgraded on the basis of corruption charges against the prime minister. [Spain](#), [Portugal](#), [Ireland](#), and [Italy](#) were downgraded due to debt woes and the concomitant effect on the euro zone. [Greece](#), another euro zone nation, was downgraded the previous year due to its sovereign debt crisis; however, the country successfully forged a rescue deal with international creditors and stayed within the Euro zone. Greek voters rewarded the hitherto unknown upstart party at the polls for these efforts. As a result, [Greece](#) was actually upgraded slightly as it proved to the world that it could endure the political and economic storms. Meanwhile, [Germany](#), [France](#), [Switzerland](#), the [United Kingdom](#), the [Netherlands](#), and the Scandinavian countries continue to post impressive ranking consistent with these countries' strong records of democracy, freedom, and peaceful transfers of power.

In Asia, [Nepal](#) was downgraded in response to continuous political instability well after landmark elections that prevails today. [Cambodia](#) was very slightly downgraded due to post-election instability that has resulted in occasional flares of violence. Despite the "trifecta of tragedy" in [Japan](#) in 2011 -- the earthquake, the ensuing tsunami, and the resulting nuclear crisis -- and the appreciable destabilization of the economic and political terrain therein, this country has only slightly been downgraded. Japan's challenges have been assessed to be transient, the government

remains accountable, and there is little risk of default. Both [India](#) and China retain their rankings; [India](#) holds a slightly higher ranking than [China](#) due to its record of democratic representation and accountability. Increasing violence and political instability in [Pakistan](#) resulted in a downgrade for this country's already low rating.

In the Americas, [Haiti](#) retained its downgraded status due to ongoing political and economic woes. [Mexico](#) was downgraded due to its alarming rate of crime. [Guatemala](#) was downgraded due to charges of corruption, the arrest of the president, and uncertainty over the outcome of elections. [Brazil](#) was downgraded due to the corruption charges erupting on the political landscape, the stalling of the economy, and the increasingly loud calls for the impeachment of President Rousseff. [Argentina](#) was downgraded due to its default on debt following the failure of talks with bond holders. [Venezuela](#) was downgraded due to the fact that the country's post-Chavez government is every bit as autocratic and nationalistic, but even more inclined to oppress its political opponents. [Colombia](#) was upgraded slightly due to efforts aimed at securing a peace deal with the FARC insurgents. A small but significant upgrade was attributed to [Cuba](#) due to its recent pro-business reforms and its normalization of ties with the United States. Meanwhile, the [United States](#), [Canada](#), [Costa Rica](#), [Panama](#), and most of the English-speaking countries of the Caribbean retain their strong rankings due to their records of stability and peaceful transfers of power.

In the Pacific, [Fiji](#) was upgraded due to its return to constitutional order and democracy with the holding of the first elections in eight years.

In Oceania, [Maldives](#) has been slightly downgraded due to the government's continued and rather relentless persecution of the country's former pro-democracy leader - former President Nasheed.

## Freedom Rankings

### Freedom Rankings

#### Freedom in the World

Editor's Note: This ranking by Freedom House quantifies political freedom and civil liberties into a single combined index on each sovereign country's level of freedom and liberty. The initials "PR" and "CL" stand for Political Rights and Civil Liberties, respectively. The number 1 represents the most free countries and the number 7 represents the least free. Several countries fall in the continuum in between. The freedom ratings reflect an overall judgment based on survey results.

#### Methodology:

PR and CL stand for political rights and civil liberties, respectively; 1 represents the most free and 7 the least free rating. The ratings reflect an overall judgment based on survey results.

? ? up or down indicates a change in political rights, civil liberties, or status since the last survey.

↑ ↓ up or down indicates a trend of positive or negative changes that took place but that were not sufficient to result in a change in political rights or civil liberties ratings of 1-7.

\* indicates a country's status as an electoral democracy.

## Human Rights

### Overview of Human Rights in Grenada

Grenada is a small constitutional monarchy with a bicameral legislature. The government works to

respect the civil and human rights of its citizens and the country's human rights record is generally good. That said, there were a few violations reported recently. There were allegations of corruption in the government and police forces. There were also a high number of incidences of child abuse. Still, Grenada enjoys one of the best human rights records in the world.

\*Human Development Index (HDI) is a composite index that measures the level of well-being in 177 nations in the world. It uses factors such as poverty, literacy, life-expectancy, education, gross domestic product, and purchasing power parity to assess the average achievements in each nation. It has been used in the United Nation's Human Development Report since 1993.

\*Human Poverty Index Ranking is based on certain indicators used to calculate the Human Poverty Index. Probability at birth of not surviving to age 40, adult literacy rate, population without sustainable access to an improved water source, and population below income poverty line are the indicators assessed in this measure.

\*The Gini Index measures inequality based on the distribution of family income or consumption. A value of 0 represents perfect equality (income being distributed equally), and a value of 100 perfect inequality (income all going to one individual).

\*The calculation of the total crime rate is the % of the total population which has been effected by property crime, robbery, sexual assault, assault, or bribery (corruption) related occurrences.

## Government Functions

### Background

After several centuries of enduring colonial rule by the British and the French, Grenada gained full independence from the United Kingdom on February 7, 1974, after almost seven years as a fully autonomous associate state of that country. It immediately adopted the parliamentary democracy system of government, a system that derives a lot from the British form of government.

### Executive Governance

The head of the state is the British monarch, who is represented in the country by the governor general, a vestige from the British colonial days. The head of the government is the prime minister, who is normally the leader of the majority party or the majority coalition in the house of representatives, the lower house of the parliament. The prime minister governs in concert with the cabinet, who are senior members of the House majority party or coalition. Technically, the prime minister and cabinet are appointed by the governor general.

As is typical of most parliamentary systems, the prime minister and cabinet must have the support of a majority of members of parliament to remain in government. The government (prime minister and cabinet) can be forced to resign if a vote of no confidence is introduced and passed in parliament. Should this occur, new parliamentary elections are held. Typically, a "caretaker" government exercises authority in the interim.

### Legislative Authority

The members of the house of representatives are elected for a five-year term in general elections in which all the adult citizens of the country can vote. The upper house of the parliament is the Senate, to which the members are nominated. The lower house of parliament is the House of Representatives, which exercises the bulk of legislative authority. Thirteen Senators make up the Senate. Of these, ten appointed by the government and three by the leader of the parliamentary opposition. There are 15 members of the House of Representatives, elected by popular vote to serve five-year terms representing single-seat districts.

### Judiciary

The country's highest judicial authority has been the West Indies Associate States Supreme Court, based in St. Lucia, with final appeals judiciable at the Privy Council in London. However, Grenada is among ten (eventually twelve) Caribbean countries that voted in February 2001 to establish a new Caribbean Court of Justice.

The Trinidad-based Caribbean Court of Justice (CCJ) was inaugurated in 2005. This body was intended to settle regional trade disputes within the Caribbean member countries of the regional trade bloc known as CARICOM, and also to ultimately serve as the new final court of appeal for the subscribing member countries, replacing the Privy Council. Presumably, one salient outcome of the change would be to facilitate and legally authorize application of the death penalty. However, the road toward making the CCJ the final appellate court of the Caribbean was expected to be long and fraught with obstacles due to constitutional provisions that would not easily accommodate such a change.

### Political Rights

The constitution was out forth on December 19, 1973. Citizens enjoy a wide range of civil and political rights guaranteed by the constitution. Grenada's constitution provides citizens with the right to change their government peacefully. Citizens exercise this right through periodic, free, and fair elections held on the basis of universal suffrage.

## Government Structure

### **Name:**

*conventional long form:*

none

*conventional short form:*

Grenada

**Type:**

Parliamentary democracy

**Executive Branch:**

Chief of state:

Queen Elizabeth II -- the monarch of the United Kingdom and head of the Commonwealth -- (since Feb. 6, 1952), represented by Governor General Cecile La Grenade (since May 7, 2013, succeeding Governor General Carlyle Arnold Glean).

Head of government:

Prime Minister Keith Mitchell (since 2013; see below for details); the next elections were to be held in 2018.

Cabinet:

Cabinet formally appointed by the governor general on the advice of the prime minister

Note:

The monarch is hereditary; the governor general is appointed by the monarch; following legislative elections, the leader of the majority party or the leader of the majority coalition is usually appointed prime minister by the governor general. To remain in government, the prime minister and cabinet must maintain the support of a majority of members of parliament.

**Legislative Branch:**

Bicameral Parliament:

Consists of the Senate and the House of Representatives

Senate:

13 members: 10 appointed by the government, 3 by the leader of the parliamentary opposition

House of Representatives:

15 members elected by popular vote to serve five-year terms representing single-seat districts

Primer in Grenada's 2013 parliamentary elections

Feb. 19, 2013 --

Parliamentary elections were set to be held on Feb. 19, 2013, in Grenada. At stake would be the 15 seats in the House of Representatives where members are elected by popular vote to serve five-year terms representing single-seat districts. The leader of the party able to maintain a majority in the House of Representatives would become prime minister and form a government. The main

parties contesting the elections would be Prime Minister Tillman Thomas' ruling National Democratic Congress (NDC), the main opposition New National Party (NNP), the Grenada United Labour Party (GULP), and the recently formed National United Front (NUF).

Note that in mid-February 2013, officials from the NDC claimed that Prime Minister Tillman Thomas survived a coup by deciding to prorogue parliament in September 2012. At a meeting of the NDC, honorary executive member Faye Thompson said: "We had to prorogue the parliament because they were about to stage a coup." The individuals involved in this apparent coup were not identified although Thompson claimed that the former tourism minister, Peter David, who was later expelled from the party, was involved in a plot to remove Thomas from office. It was not known if this disclosure could be verified or would have an impact on the voting intentions of the Grenadian citizenry.

On election day, voters in Grenada went to the polls and cast their ballots. When the polling stations closed and the votes were counted, Tillman Thomas' NDC went down to defeat with Dr. Keith Mitchell's NNP sweeping to convincing victory. Indeed, the NNP managed to win all 15 seats at stake. Mitchell -- a mathematician who served as prime minister for more than a dozen years in the late 1990s and most of the next decade -- was set to return to power. To that end, on Feb. 20, 2013, Mitchell was sworn in as the new prime minister of Grenada and promised to make good on his campaign commitments, and also to unite the country after the acrimonious feelings that surfaced during the pre-election campaign period. Mitchell also subsequently said that he had received advice from local and international leaders on how to deal with the scenario of having no opposition in the parliament of a democratic country.

The next elections were to be held in 2018

**Judicial Branch:**

Eastern Caribbean Supreme Court, consisting of a court of Appeal and a High Court of Justice (a High Court judge is assigned to and resides in Grenada)

Note:

Grenada was among ten (eventually twelve) signatory countries that voted in February 2001 to establish a regional Caribbean Court of Justice, which when operational will become the final court of record.

The Trinidad-based Caribbean Court of Justice (CCJ) was inaugurated in 2005. This body was intended to settle regional trade disputes within the Caribbean member countries of the regional trade bloc known as CARICOM, and also to ultimately serve as the new final court of appeal for the subscribing member countries, replacing the Privy Council. Presumably, one salient outcome of the change would be to facilitate and legally authorize application of the death penalty.

However, the road toward making the CCJ the final appellate court of the Caribbean was expected to be long and fraught with obstacles due to constitutional provisions that would not easily accommodate such a change.

**Constitution:**

December 19, 1973

**Legal System:**

Based on English common law

**Major Political Parties and Leaders:**

Grenada United Labor Party or GULP [Wilfred HAYES]

National Democratic Congress or NDC [Tillman THOMAS]

New National Party or NNP [Keith MITCHELL]

**Suffrage:**

18 years of age; universal

**Administrative Divisions:**

6 parishes and 1 dependency: Carriacou and Petit Martinique, Saint Andrew, Saint David, Saint George, Saint John, Saint Mark, Saint Patrick

Mitchell also subsequently said that he had received advice from local and international leaders on how to deal with the scenario of having no opposition in the parliament of a democratic country.

---

## Foreign Relations

### General Relations

The United States, Venezuela and Taiwan have embassies in Grenada. A resident commissioner represents the United Kingdom (as opposed to the governor general, who represents the British monarch). Grenada has been recognized by most members of the United Nations and maintains diplomatic missions in the United Kingdom, the United States, Venezuela, and Canada. Grenada is a member of the British Commonwealth. It joined the United Nations in 1974, and the World Bank and the International Monetary Fund (IMF) in 1975.

### Regional Relations

Grenada is a member of the Organization of American States, the Caribbean Development Bank, the Caribbean Community and Common Market, the Organization of Eastern Caribbean States, and the Eastern Caribbean's Regional Security System. Grenada is also a member of the Economic Commission for Latin America and the Caribbean; the Latin American Economic System, also known as "Sistema Económico Latinoamericana;" and the Agency for the Prohibition of Nuclear Weapons in Latin America and the Caribbean, or "Organismo para la Proscripcion de las Armas Nucleares en la America Latina y el Caribe."

A basic description of key regional organizations follows:

The Organization of American States or OAS was established on April 30, 1948, to promote regional peace and security as well as economic and social development. The OAS has 35 members and 31 observers.

The Caribbean Development Bank was established on Oct. 3, 1969, to promote economic development and cooperation among its members. Member states comprise: Anguilla, Antigua and Barbuda, Bahamas, Barbados, Belize, British Virgin Islands, Cayman Islands, Colombia, Dominica, Grenada, Guyana, Jamaica, Mexico, Montserrat, Saint Kitts and Nevis, Saint Lucia, Saint Vincent and the Grenadines, Trinidad and Tobago, Turks and Caicos Islands, and Venezuela. The extra-regional members are Canada, France, Germany, Italy, and the United Kingdom.

The Economic Commission for Latin America and the Caribbean or ECLAC was established on Feb. 25, 1948, as the Economic Commission for Latin America to promote economic development as a regional commission of the United Nations Economic and Social Council. ECLAC has 41 members and seven associate members..

The Caribbean Community and Common Market was established on July 4, 1973, to promote regional economic integration and development, especially among the less developed countries. Full membership in this organization is held by Antigua and Barbuda, Barbados, Belize, Dominica, Grenada, Guyana, Jamaica, Montserrat, Saint Kitts and Nevis, Saint Lucia, Saint Vincent and the Grenadines, Suriname, and Trinidad and Tobago. The Bahamas is also a full member, but does not participate in the Common Market. Also, Haiti has satisfied all the conditions for Caricom membership except for making the required deposit with the organization's secretary-general. Anguilla, the British Virgin Islands, and the Turks and Caicos Islands are associate Caricom members. Aruba, Bermuda, Cayman Islands, Colombia, Dominican Republic, Mexico, Netherlands Antilles, Puerto Rico, and Venezuela have observer status.

The Agency for the Prohibition of Nuclear Weapons in Latin America and the Caribbean, known in Spanish as "Organismo para la Proscripción de las Armas Nucleares en la América Latina y el Caribe," was established on February 14, 1967, to encourage the peaceful uses of atomic energy and prohibit nuclear weapons. It has 30 member countries.

The Latin American Economic System, also known as "Sistema Económico Latinoamericana," was established Oct. 17, 1975, to promote economic and social development through regional cooperation. Members comprise Argentina, Barbados, Belize, Bolivia, Brazil, Chile, Colombia, Costa Rica, Cuba, Dominican Republic, Ecuador, El Salvador, Grenada, Guatemala, Guyana, Haiti, Honduras, Jamaica, Mexico, Nicaragua, Panama, Paraguay, Peru, Suriname, Trinidad and Tobago, Uruguay, and Venezuela.

In September 2004, Hurricane Ivan savaged Grenada leaving scores dead and over two-thirds of the entire population homeless. Meanwhile up to 90 percent of all buildings were damaged in some way. Included in the destruction was the headquarters for the Red Cross as well as the prison. Although Ivan was a natural disaster more than a political event, the effects on Grenada's traumatized society, the national economy and, indeed, the political environment, was expected to be monumental. Other Caribbean nations provided military, financial and humanitarian assistance toward Grenada's reconstruction efforts.

Regional support was offered in 2005 after Hurricane Emily damaged crops and homes on the island.

The Trinidad-based Caribbean Court of Justice (CCJ) was inaugurated in 2005. This body was intended to settle regional trade disputes within the Caribbean member countries of the regional trade bloc known as CARICOM, and also to ultimately serve as the new final court of appeal for the subscribing member countries, replacing the Privy Council. Presumably, one salient outcome of the change would be to facilitate and legally authorize application of the death penalty. However, the road toward making the CCJ the final appellate court of the Caribbean was expected to be long and fraught with obstacles due to constitutional provisions that would not easily accommodate such a change.

The year 2006 was also marked by the issue of jurisprudence, a year after the CCJ came into being. At issue in mid-2006 was the matter of capital punishment. Specifically, Barbadian authorities were hoping that the CCJ would overturn a ruling by the Privy Council regarding the sentences for two men convicted of murder in 1999, essentially allowing the two men to be hanged for their crime. The Barbadian government's position has been shared by counterparts in other Caribbean countries, most of whom have taken a hard-line stance in response to the problem of rising crime. Nevertheless, it has been surmised that the CCJ may not be inclined to set a new precedent so soon after its inception. Instead, justices may well adhere to the principle of "jurisprudence constante," in which the stability of court rulings is preserved.

### Other Significant Relations

The United States (U.S.) government established an embassy in Grenada in November 1983. The U.S. ambassador to Grenada resides in Bridgetown, Barbados. The embassy in Grenada is staffed by a chargé d'affaires who reports to the ambassador in Bridgetown.

The U.S. Agency for International Development has played a major role in Grenada's development, providing more than \$120 million in economic assistance from 1984 to 1993. Following the closure in July 1996 of the USAID regional mission for the Eastern Caribbean, U.S. assistance has been channeled primarily through multilateral agencies such as the World Bank.

Peace Corps volunteers in Grenada teach remedial reading, English-language skills, and vocational training.

Grenada is a beneficiary of the U.S. Caribbean Basin Initiative. In addition, the country receives counter-narcotics assistance from the U.S. and cooperates in U.S.-led counter narcotics enforcement. In 1995, the U.S. and Grenada signed a maritime law enforcement treaty. In 1996, they signed a mutual legal assistance treaty and an extradition treaty as well as an overflight/order-to-land amendment to the maritime law enforcement treaty.

Some U.S. military training is given to Grenadian security and defense forces. The country has hosted U.S. military exercises and, reciprocally, the U.S. military has participated in civic construction and humanitarian assistance programs on the island. Finally, Grenada is an increasingly popular destination for U.S. tourists, who make up the majority of foreign visitors to its resorts. About 800 American medical students attend the medical school at St. George's University.

Grenada, like many other Caribbean countries, has a policy toward Cuba which is in opposition to that of the United States. It is unlikely to lead to substantial tension with the U.S. At the Quebec Summit of the Americas in April 2001, Grenada joined with other Caribbean countries in a strong expression of disapproval that Cuba was the one Western Hemisphere country not invited to participate in the summit.

More recently, in 2002, Grenada, in addition to other Caribbean countries, expressed disapproval with the United States' decision to withhold aid funding to Haiti.

As well, many agro-based Caribbean countries were not pleased about the Bush administration's farm bill, which adversely affects small countries dependent upon agricultural production, where competitiveness within the global marketplace is essential.

In addition, Caribbean countries expressed their view to the Bush administration in the United States that small states in the hemisphere would not allow their security concerns to be overshadowed by the war against terrorism. Most Caribbean countries believe that security for the region is linked to issues such as unemployment, HIV/AIDS, poverty and drug trafficking, as well as trade within the World Trade Organisation and the Free Trade Area of the Americas. Although the Organization of American States (OAS) approved the Inter-American Convention against Terrorism at its 32nd Regular Session, the Caribbean countries have made it clear that the issue of security in the region is broader than U.S.-specific interests.

In 2003, Prime Minister Mitchell met with United States President George W. Bush on issues concerning hemispheric relations.

The foreign policy of the current government in Grenada has been highly controversial not just in the country but across the globe. Grenada has established close ties with Taiwan and is looking to strengthening relationship with Libya.

In fact, the prime minister of Taiwan visited Grenada in September 2001, following a visit by the Grenadian prime minister Keith Mitchell last year. The two countries signed several agreements aimed to boost bilateral relations. This was the first overseas visit by Taiwanese prime minister, Chang Chen-Hsiung since his election in October 2000. He also pledged a significant increase in Taiwanese aid for development of Grenada.

In a radical shift, however, in 2005, Grenada re-established diplomatic ties with China, at the expense of its former diplomatic partner Taiwan.

Meanwhile, the policies of the Mitchell government towards Libya have attracted sharp criticism from the opposition parties, who have cautioned Mitchell that Libya continues to be on the list published by the United States State Department of countries that support terrorism. In September 2001, Prime Minister Mitchell led a top-level delegation on a state visit to Libyan capital, Tripoli. The move was being seen in Grenada as the first step towards establishment of full diplomatic relations between Grenada and Libya. Opposition leader Baptiste, however, urged the government to be careful before establishing full diplomatic relations with Libya.

In another controversial turn of events, Grenada supported Japanese attempts to negate a proposal by the International Whaling Commission to carve out a sanctuary for whales in the international waters, in order to preserve the threatened species. Environmentalists complained that Grenada and several other developing countries had been "bribed by Japanese economic aid."

---

## National Security

### External Threats

No foreign powers pose a direct threat to Grenada. The last foreign military incursion occurred in

October 1983. A series of events prompted the United States to send troops to the island, including a 1979 coup that brought a left-wing political party to power, a period of intense political infighting within that party that ultimately led to the 1983 murder of Grenada's prime minister and several cabinet members, and a virtual break-down in civil order (see section below on insurgencies).

## **Crime**

The overall rate of crime in Grenada is relatively low. It is a small-scale producer of cannabis and serves as a minor interim destination for marijuana and cocaine bound for the United States (U.S.). The U.S. Department of State warns of the existence of street crime in Grenada, particularly in areas frequented by tourists.

## **Insurgencies**

There are no insurgent movements inside or outside of Grenada that threaten its national security. It experienced a period of instability shortly after attaining its full independence in February 1974, however. In March 1979, a Marxist-Leninist oriented movement staged a coup, ousting the nation's first prime minister, Eric Gairy. Maurice Bishop succeeded him. His administration moved to strengthen Grenada's ties to Cuba, the Soviet Union, and other eastern bloc countries. In October 1983, Bishop and several cabinet members were executed during a power struggle within his administration. A breakdown in civil order ensued. At the behest of Grenada's governor general and the Organization of Eastern Caribbean States (OECS), the United States sent troops to the island on October 25. They facilitated the evacuation of U.S. citizens and the restoration of order. In December 1984, the country held national elections without incident. Suspended in 1979, Grenada's constitution was subsequently restored. There has been no recurrence of similarly tumultuous political conditions in Grenada.

## **Terrorism**

Terrorism does not constitute a specific threat to Grenada's national security. It is party to all twelve of the UN's conventions and protocols pertaining to terrorism.

## **Economic Overview**

---

## Economic Overview

### *Overview*

Grenada has a largely tourism-based, small, open economy. Over the past two decades, the economy has shifted from one of agriculture-dominant into that of services-dominant, with tourism serving as the leading foreign currency earning sector. The country's principal export crops are the spices nutmeg and mace (Grenada is the world's second largest producer of nutmeg after Indonesia). Other crops for export include cacao, citrus fruits, bananas, cloves, and cinnamon. Manufacturing industries in Grenada operate mostly on a small scale, including the production of beverages and other foodstuffs, textiles, and the assembly of electronic components for export. The economy remains vulnerable to shocks, such as adverse external conditions and natural disasters.

After a short recovery in the aftermath of the devastation caused by the hurricanes in 2004 and 2005, Grenada was again hit hard by the global economic crisis. With a significantly weakening tourism industry and foreign direct investment, real GDP growth slowed substantially in 2008 and a large contraction was recorded in 2009. Despite the difficult circumstances, the government responded to the global financial slowdown with appropriate policy adjustment, focusing on mitigating the short-term impact of the external shocks while laying a foundation for sustainable, broad-based economic growth. The government also increased spending on social assistance programs, while continuing its fiscal reform program. Growth declined again in 2010 but there were signs of a modest recovery in the first quarter of 2011, when tourism activity picked up. Construction too was expected to grow as some previously delayed projects started up. In March 2011, the International Monetary Fund gave Grenada officials credit for addressing some structural impediments to private sector growth, such as reducing the number of days it takes to start a business, and establishing a separate land registry. By the fourth quarter of 2011, though, the East Asian island of Taiwan was blocking cruise ships from paying fees to the Grenada government. The Asian country had essentially gone out on an offensive to recover US\$21 million (figure varies based on exchange rate) that Grenada owes its state bank. Grenada was forced to default on its loan with Taiwan after Hurricane Ivan devastated its economy in 2004. The previous leadership also severed diplomatic relations with the country in the aftermath of the hurricane. The move greatly upset the Taiwanese government, as it believed that Grenada had chosen to ally with Mainland China, which had offered Grenada a lucrative package in the hurricane aftermath. Taiwan in 2006 won a summary judgment against Grenada to recover its loan balance. In recent times, Grenadian public officials have met with Taiwanese officials in an effort to resolve the

dispute. “We are faced with a situation where Taiwan is making such an unreasonable demand for full payment of the total amount of that money which is unfair to us,” Prime Minister Thomas complained during a 2011 news conference. “This is a national issue and we are working on all fronts to bring this matter to an end. Grenada is unable to meet the demand for full payment to the Taiwanese, so we are looking at all our options.” The fiscal situation deteriorated in 2011, reflecting revenue shortfalls due to the extension of various temporary tax exemptions.

By May 2012, the IMF noted that following two years of consecutive decline, there were signs that a fragile recovery may be underway in Grenada. Continued growth in agriculture and a gradual recovery in tourism stay-over arrivals was expected to drive a modest increase in real GDP growth for 2012. Still, private sector credit growth remained sluggish and the current account deficit was expected to remain around 25 percent of GDP, reflecting high food and fuel prices. In September 2012, the government of Grenada failed to pay the coupon due Sept. 15, 2012, on its US\$193 million bond due in 2025. As such, in October, Standard & Poor’s lowered its foreign and local currency sovereign credit ratings on the country.

In March 2013, Grenada's new government appointed advisers to seek a restructuring of its US\$193 million 2025 bond as part of a broader overhaul of the island’s finances.

“It is now time for Grenada to confront the fact that it cannot continue to pay its debts on current terms, and that the restoration of growth requires the debt overhang to be resolved,” Prime Minister Keith Mitchell was quoted by Reuters as saying. “We need a fresh start.”

In April 2013, Grenada defaulted on the bond and by May, bondholders were left being unlikely to secure any settlement. In April, Prime Minister Mitchell had unveiled a budget in which debt payments made up 41 percent of state expenditure.

“The sheer scale of our debt overhang against the backdrop of a shrinking economy has become a binding constraint on growth,” he said.

Public debt-to-GDP was nearly 110 percent in 2013, leaving the Mitchell administration limited room to engage in public investments and social spending. In 2013, the government announced a structural adjustment program that included a plan to increase tax revenue. While inflation was lower than expected, the economy continued to face significant challenges from high unemployment, a large debt overhang, and balance sheets weakened by impaired loans.

In July 2014, Caribbean 360 reported that Grenada had recorded significant growth in tourism in the first half of the year despite the depressed economy.

“We may have a country that we met when we came into office with soaring unemployment and we may have been forced to raise some taxes...but that hasn’t stopped our tourism sector,”

Grenada's Tourism Minister Alexandria Otway Noel told a group of regional and international tourism officials. She went on to say that Grenada had seen a 12 percent increase in cruise ship arrivals in 2014, with big increases from Canada, Europe and the U.S.

In April 2015, the Wall Street Journal reported that Grenada had reached an agreement with its creditors to restructure \$262 million of bonds that it had defaulted on in 2013. While the relief reportedly represented 19 percent of Grenada's GDP, the country still had \$907 million in public-sector debt.

In May 2015, The New Today reported that Grenada actually had the best-performing economy in the member states of the Organisation of Eastern Caribbean States (OECS). The Member of Parliament for St. David said that strong performances in agriculture, tourism and medical education contributed to growth in Grenada's economy. Also, Minister Joseph said the current government had inherited a 40 percent rate of unemployment when it came into office in 2013 and by 2014 it was down to 29.5 percent.

Then in August 2015, the Caribbean Journal also reported that Grenada's economy was on the rise. The country's GDP growth forecast was revised upward significantly by the IMF, following the organization's latest visit to the country.

While Grenada had initially been projected to growth by 1.7 percent earlier this year, the island's 2015 growth projection was now 3.1 percent.

"The fiscal performance is also positive, with the Government on track this year to deliver its first primary surplus in over a decade. Tax revenues have recovered to pre-crisis levels and expenditures are being kept under strict control," Nicole Laframboise, who led the mission to the country, was quoted by the Caribbean Journal as saying. "The Government has continued to repay its budget expenditure arrears and is expected to clear them fully by the end of this year."

### ***Economic Performance***

Following robust growth of in 2007, real GDP slowed sharply in 2008 and turned to a large negative rate in 2009, reflecting a significant decline in tourism and foreign direct investment due to the global economic crisis. The economy recorded another contraction in 2010. Inflation surged in 2008, driven by higher world oil and food prices, but fell rapidly in 2009 before climbing again in 2010. Large fiscal slippages, along with cuts in grants, resulted in large fiscal deficit in 2006 and 2007, compared to a surplus in 2005. Overall, growth was stagnant from 2010 to 2012.

According to CountryWatch estimated calculations for 2014:

Real GDP growth rate was: 1.1 percent

The fiscal deficit/surplus as percent of GDP (%) was: -5.5 percent

Inflation was measured at: 2.3 percent

## Economic Performance Index

### Economic Performance Index

The Economic Performance rankings are calculated by CountryWatch's editorial team, and are based on criteria including sustained economic growth, monetary stability, current account deficits, budget surplus, unemployment and structural imbalances. Scores are assessed from 0 to 100 using this aforementioned criteria as well as CountryWatch's proprietary economic research data and models.

	Bank stability risk	Monetary/ Currency stability	Government Finances	Empl./ Unempl.	Econ.GNP growth or decline/ forecast
	0 - 100	0 - 100	0 - 100	0 - 100	%

# **Chapter 4**

## **Investment Overview**

---

## Foreign Investment Climate

### Background

Grenada relies on tourism as its main source of foreign exchange especially since the construction of an international airport in 1985. Hurricanes Ivan (2004) and Emily (2005) severely damaged the agricultural sector - particularly nutmeg and cocoa cultivation - which had been a key driver of economic growth. Grenada has rebounded from the devastating effects of the hurricanes but is now saddled with the debt burden from the rebuilding process. Public debt-to-GDP is nearly 110%, leaving the THOMAS administration limited room to engage in public investments and social spending. Strong performances in construction and manufacturing, together with the development of tourism and an offshore financial industry, have also contributed to growth in national output; however, economic growth will likely be stagnant in 2010 after a sizeable contraction in 2009, because of the global economic slowdown's effects on tourism and remittances.

### Foreign Investment Assessment

#### Openness to Foreign Investment

Grenada is very open to foreign investment. The present government has been making efforts to attract foreign investment since it took power in 1995. The most effective reform was the removal of the income tax on foreign investors in 1994. The government has also made the development of the infrastructure a top priority, including the improvement of water resources, roads, telecommunications and energy production.

Recent developments which contribute to Grenada's overall investment attractiveness include:

- an expansion of Caribbean Airlines with upgraded service to several nations including Grenada;
- the proposal for a major telecommunications center in Grenada, as well as several other islands in the region; plans to develop the offshore financial services sector;
- plans to double the spending on infrastructure development.

-Japan recent announcement of a \$5.1 million grant for the development of a fishing center in Grenada

#### Transparency of Regulatory System

Regulations affecting both local and foreign investors in Grenada are transparent and evenly applied in a nondiscriminatory manner.

### **Labor Force**

Total: 42,300 estimated

By occupation: agriculture 24%, industry 14%, services 62%

### **Agriculture and Industry**

Agriculture products: bananas, cocoa, nutmeg, mace, citrus, avocados, root crops, sugarcane, corn, vegetables

Industries: food and beverages, textiles, light assembly operations, tourism, construction

### **Import Commodities and Partners**

Commodities: food, manufactured goods, machinery, chemicals, fuel

Partners: US 30.9%, Trinidad and Tobago 24.6%, UK 5.5%, Japan 4.4%

### **Export Commodities and Partners**

Commodities: bananas, cocoa, nutmeg, fruit and vegetables, clothing, mace

Partners: US 16.3%, Germany 14%, Netherlands 9.7%, Saint Lucia 8.6%, Antigua and Barbuda 5.8%, UK 5.7%, Dominica 5.2%

### **Telephone System**

Telephones- main lines in use: 33,500 km

Telephones- mobile cellular: 7,600 km

*General Assessment:* automatic, islandwide telephone system

*Domestic:* interisland VHF and UHF radiotelephone links

*International:* country code - 1-473; new SHF radiotelephone links to Trinidad and Tobago and Saint Vincent; VHF and UHF radio links to Trinidad

### **Internet**

Internet Hosts: 18

Internet users: 15,000

### **Roads, Airports, Ports and Harbors**

Highways: 1,040 km

Ports and harbors: Grenville, Saint George's

Airports: 3; w/paved runways: 3

### **Legal System and Considerations**

Grenada's legal system is based on English common law.

#### Dispute Settlement

The judiciary, a part of the Eastern Caribbean legal system, is independent. Final appeal may be made to the Privy Council in the United Kingdom.

As a member of the World Trade Organization, Grenada accepts binding international arbitration between foreign investors and the state.

### **Corruption Perception Ranking**

N/A; see full list, as reported by Transparency International, elsewhere in this Country Review.

### **Cultural Considerations**

As in all of the Caribbean, it is important to dress appropriately, although casual self-presentation is customary. Slovenly dress, a lack of footwear in public places, walking in public without a shirt, and beach apparel in any venue other than on the beach, is considered to be in very poor taste.

#### **For More information see:**

United States' State Department Commercial Guide

---

### **Foreign Investment Index**

Foreign Investment Index

**The Foreign Investment Index** is a proprietary index measuring attractiveness to international investment flows. The Foreign Investment Index is calculated using an established methodology by CountryWatch's Editor-in-Chief and is based on a given country's economic stability (sustained economic growth, monetary stability, current account deficits, budget surplus), economic risk (risk of non-servicing of payments for goods or services, loans and trade-related finance, risk of sovereign default), business and investment climate (property rights, labor force and laws, regulatory transparency, openness to foreign investment, market conditions, and stability of government). Scores are assigned from 0-10 using the aforementioned criteria. A score of 0 marks the lowest level of foreign investment viability, while a score of 10 marks the highest level of foreign investment viability, according to this proprietary index.

Zambia	4.5-5
Zimbabwe	3.5

#### Editor's Note:

As of 2015, the global economic crisis (emerging in 2008) had affected many countries across the world, resulting in changes to their rankings. Among those countries affected were top tier economies, such as the [United Kingdom](#), [Iceland](#), [Switzerland](#) and [Austria](#). However, in all these cases, their rankings have moved back upward in the last couple of years as anxieties have eased. Other top tier countries, such as [Spain](#), [Portugal](#), [Ireland](#), and [Italy](#), suffered some effects due to debt woes and the concomitant effect on the euro zone. Greece, another euro zone nation, was also downgraded due to its sovereign debt crisis; however, Greece's position on the precipice of default incurred a sharper downgrade than the other four euro zone countries mentioned above. Cyprus' exposure to Greek bank yielded a downgrade in its case. Slovenia and [Latvia](#) have been slightly downgraded due to a mix of economic and political concerns but could easily be upgraded in a future assessment, should these concerns abate. Meanwhile, the crisis in eastern [Ukraine](#) fueled downgrades in that country and neighboring [Russia](#).

Despite the "trifecta of tragedy" in [Japan](#) in 2011 -- the earthquake, the ensuing tsunami, and the resulting nuclear crisis -- and the appreciable destabilization of the economic and political terrain therein, this country has only slightly been downgraded. Japan's challenges have been assessed to be transient, the government remains accountable, and there is little risk of default. Both [India](#) and China retain their rankings; [India](#) holds a slightly higher ranking than [China](#) due to its record of democratic representation and accountability.

There were shifts in opposite directions for [Mali](#) and [Nigeria](#) versus the [Central African Republic](#), [Burkina Faso](#), and [Burundi](#). [Mali](#) was slightly upgraded due to its efforts to return to constitutional order following the 2012 coup and to neutralize the threat of separatists and Islamists. Likewise, a new government in [Nigeria](#) generated a slight upgrade as the country attempts to confront corruption, crime, and terrorism. But the [Central African Republic](#) was downgraded due to the takeover of the government by Seleka rebels and the continued decline into lawlessness in that country. Likewise, the attempts by the leaders of [Burundi](#) and [Burkina Faso](#) to hold onto power by by-passing the constitution raised eyebrows and resulted in downgrades.

Political unrest in [Libya](#) and [Algeria](#) have contributed to a decision to marginally downgrade these countries as well. [Syria](#) incurred a sharper downgrade due to the devolution into de facto civil war and the dire security threat posed by Islamist terrorists. [Iraq](#) saw a similar downgrade as a result of the takeover of wide swaths of territory and the threat of genocide at the hands of Islamist terrorists. [Yemen](#), likewise, has been downgraded due to political instability at the hands of secessionists, terrorists, Houthi rebels, and the intervention of external parties. Conversely, [Egypt](#) and [Tunisia](#) saw slight upgrades as their political environments stabilize.

At the low end of the spectrum, devolving security conditions and/or economic crisis have resulted in countries like [Pakistan](#), [Afghanistan](#), [Somalia](#), and [Zimbabwe](#) maintaining their low ratings.

The [United States](#) continues to retain its previous slight downgrade due to the enduring threat of default surrounding the debt ceiling in that country, matched by a conflict-ridden political climate. In the case of [Mexico](#), there is limited concern about default, but increasing alarm over the security situation in that country and the government's ability to contain it. In [Argentina](#), a default to bond holders resulted in a downgrade to that country. Finally, a small but significant upgrade was attributed to [Cuba](#) due to its recent pro-business reforms and its normalization of ties with the United States.

## Corruption Perceptions Index

### Corruption Perceptions Index

Transparency International: [Corruption Perceptions Index](#)

#### Editor's Note:

Transparency International's [Corruption Perceptions Index](#) is a composite index which ranks countries in terms of the degree to which corruption is perceived to exist among public officials. This index indicates the views of national and international business people and analysts about the levels of corruption in each country. The highest (and best) level of transparency is indicated by the number, 10. The lower (and worse) levels of transparency are indicated by lower numbers.

Rank	Country/Territory	CPI 2009 Score	Surveys Used	Confidence Range
1	New Zealand	9.4	6	9.1 - 9.5
2	Denmark	9.3	6	9.1 - 9.5
3	Singapore	9.2	9	9.0 - 9.4
3	Sweden	9.2	6	9.0 - 9.3
5	Switzerland	9.0	6	8.9 - 9.1
6	Finland	8.9	6	8.4 - 9.4
6	Netherlands	8.9	6	8.7 - 9.0
8	Australia	8.7	8	8.3 - 9.0
8	Canada	8.7	6	8.5 - 9.0
8	Iceland	8.7	4	7.5 - 9.4

11	Norway	8.6	6	8.2 - 9.1
12	Hong Kong	8.2	8	7.9 - 8.5
12	Luxembourg	8.2	6	7.6 - 8.8
14	Germany	8.0	6	7.7 - 8.3
14	Ireland	8.0	6	7.8 - 8.4
16	Austria	7.9	6	7.4 - 8.3
17	Japan	7.7	8	7.4 - 8.0
17	United Kingdom	7.7	6	7.3 - 8.2
19	United States	7.5	8	6.9 - 8.0
20	Barbados	7.4	4	6.6 - 8.2
21	Belgium	7.1	6	6.9 - 7.3
22	Qatar	7.0	6	5.8 - 8.1
22	Saint Lucia	7.0	3	6.7 - 7.5
24	France	6.9	6	6.5 - 7.3
25	Chile	6.7	7	6.5 - 6.9
25	Uruguay	6.7	5	6.4 - 7.1
27	Cyprus	6.6	4	6.1 - 7.1
27	Estonia	6.6	8	6.1 - 6.9

27	Slovenia	6.6	8	6.3 - 6.9
30	United Arab Emirates	6.5	5	5.5 - 7.5
31	Saint Vincent and the Grenadines	6.4	3	4.9 - 7.5
32	Israel	6.1	6	5.4 - 6.7
32	Spain	6.1	6	5.5 - 6.6
34	Dominica	5.9	3	4.9 - 6.7
35	Portugal	5.8	6	5.5 - 6.2
35	Puerto Rico	5.8	4	5.2 - 6.3
37	Botswana	5.6	6	5.1 - 6.3
37	Taiwan	5.6	9	5.4 - 5.9
39	Brunei Darussalam	5.5	4	4.7 - 6.4
39	Oman	5.5	5	4.4 - 6.5
39	Korea (South)	5.5	9	5.3 - 5.7
42	Mauritius	5.4	6	5.0 - 5.9
43	Costa Rica	5.3	5	4.7 - 5.9
43	Macau	5.3	3	3.3 - 6.9
45	Malta	5.2	4	4.0 - 6.2
46	Bahrain	5.1	5	4.2 - 5.8

46	Cape Verde	5.1	3	3.3 - 7.0
46	Hungary	5.1	8	4.6 - 5.7
49	Bhutan	5.0	4	4.3 - 5.6
49	Jordan	5.0	7	3.9 - 6.1
49	Poland	5.0	8	4.5 - 5.5
52	Czech Republic	4.9	8	4.3 - 5.6
52	Lithuania	4.9	8	4.4 - 5.4
54	Seychelles	4.8	3	3.0 - 6.7
55	South Africa	4.7	8	4.3 - 4.9
56	Latvia	4.5	6	4.1 - 4.9
56	Malaysia	4.5	9	4.0 - 5.1
56	Namibia	4.5	6	3.9 - 5.1
56	Samoa	4.5	3	3.3 - 5.3
56	Slovakia	4.5	8	4.1 - 4.9
61	Cuba	4.4	3	3.5 - 5.1
61	Turkey	4.4	7	3.9 - 4.9
63	Italy	4.3	6	3.8 - 4.9
63	Saudi Arabia	4.3	5	3.1 - 5.3

65	Tunisia	4.2	6	3.0 - 5.5
66	Croatia	4.1	8	3.7 - 4.5
66	Georgia	4.1	7	3.4 - 4.7
66	Kuwait	4.1	5	3.2 - 5.1
69	Ghana	3.9	7	3.2 - 4.6
69	Montenegro	3.9	5	3.5 - 4.4
71	Bulgaria	3.8	8	3.2 - 4.5
71	FYR Macedonia	3.8	6	3.4 - 4.2
71	Greece	3.8	6	3.2 - 4.3
71	Romania	3.8	8	3.2 - 4.3
75	Brazil	3.7	7	3.3 - 4.3
75	Colombia	3.7	7	3.1 - 4.3
75	Peru	3.7	7	3.4 - 4.1
75	Suriname	3.7	3	3.0 - 4.7
79	Burkina Faso	3.6	7	2.8 - 4.4
79	China	3.6	9	3.0 - 4.2
79	Swaziland	3.6	3	3.0 - 4.7
79	Trinidad and Tobago	3.6	4	3.0 - 4.3

83	Serbia	3.5	6	3.3 - 3.9
84	El Salvador	3.4	5	3.0 - 3.8
84	Guatemala	3.4	5	3.0 - 3.9
84	India	3.4	10	3.2 - 3.6
84	Panama	3.4	5	3.1 - 3.7
84	Thailand	3.4	9	3.0 - 3.8
89	Lesotho	3.3	6	2.8 - 3.8
89	Malawi	3.3	7	2.7 - 3.9
89	Mexico	3.3	7	3.2 - 3.5
89	Moldova	3.3	6	2.7 - 4.0
89	Morocco	3.3	6	2.8 - 3.9
89	Rwanda	3.3	4	2.9 - 3.7
95	Albania	3.2	6	3.0 - 3.3
95	Vanuatu	3.2	3	2.3 - 4.7
97	Liberia	3.1	3	1.9 - 3.8
97	Sri Lanka	3.1	7	2.8 - 3.4
99	Bosnia and Herzegovina	3.0	7	2.6 - 3.4
99	Dominican Republic	3.0	5	2.9 - 3.2

99	Jamaica	3.0	5	2.8 - 3.3
99	Madagascar	3.0	7	2.8 - 3.2
99	Senegal	3.0	7	2.5 - 3.6
99	Tonga	3.0	3	2.6 - 3.3
99	Zambia	3.0	7	2.8 - 3.2
106	Argentina	2.9	7	2.6 - 3.1
106	Benin	2.9	6	2.3 - 3.4
106	Gabon	2.9	3	2.6 - 3.1
106	Gambia	2.9	5	1.6 - 4.0
106	Niger	2.9	5	2.7 - 3.0
111	Algeria	2.8	6	2.5 - 3.1
111	Djibouti	2.8	4	2.3 - 3.2
111	Egypt	2.8	6	2.6 - 3.1
111	Indonesia	2.8	9	2.4 - 3.2
111	Kiribati	2.8	3	2.3 - 3.3
111	Mali	2.8	6	2.4 - 3.2
111	Sao Tome and Principe	2.8	3	2.4 - 3.3
111	Solomon Islands	2.8	3	2.3 - 3.3

111	Togo	2.8	5	1.9 - 3.9
120	Armenia	2.7	7	2.6 - 2.8
120	Bolivia	2.7	6	2.4 - 3.1
120	Ethiopia	2.7	7	2.4 - 2.9
120	Kazakhstan	2.7	7	2.1 - 3.3
120	Mongolia	2.7	7	2.4 - 3.0
120	Vietnam	2.7	9	2.4 - 3.1
126	Eritrea	2.6	4	1.6 - 3.8
126	Guyana	2.6	4	2.5 - 2.7
126	Syria	2.6	5	2.2 - 2.9
126	Tanzania	2.6	7	2.4 - 2.9
130	Honduras	2.5	6	2.2 - 2.8
130	Lebanon	2.5	3	1.9 - 3.1
130	Libya	2.5	6	2.2 - 2.8
130	Maldives	2.5	4	1.8 - 3.2
130	Mauritania	2.5	7	2.0 - 3.3
130	Mozambique	2.5	7	2.3 - 2.8
130	Nicaragua	2.5	6	2.3 - 2.7

130	Nigeria	2.5	7	2.2 - 2.7
130	Uganda	2.5	7	2.1 - 2.8
139	Bangladesh	2.4	7	2.0 - 2.8
139	Belarus	2.4	4	2.0 - 2.8
139	Pakistan	2.4	7	2.1 - 2.7
139	Philippines	2.4	9	2.1 - 2.7
143	Azerbaijan	2.3	7	2.0 - 2.6
143	Comoros	2.3	3	1.6 - 3.3
143	Nepal	2.3	6	2.0 - 2.6
146	Cameroon	2.2	7	1.9 - 2.6
146	Ecuador	2.2	5	2.0 - 2.5
146	Kenya	2.2	7	1.9 - 2.5
146	Russia	2.2	8	1.9 - 2.4
146	Sierra Leone	2.2	5	1.9 - 2.4
146	Timor-Leste	2.2	5	1.8 - 2.6
146	Ukraine	2.2	8	2.0 - 2.6
146	Zimbabwe	2.2	7	1.7 - 2.8
154	Côte d'Ivoire	2.1	7	1.8 - 2.4

154	Papua New Guinea	2.1	5	1.7 - 2.5
154	Paraguay	2.1	5	1.7 - 2.5
154	Yemen	2.1	4	1.6 - 2.5
158	Cambodia	2.0	8	1.8 - 2.2
158	Central African Republic	2.0	4	1.9 - 2.2
158	Laos	2.0	4	1.6 - 2.6
158	Tajikistan	2.0	8	1.6 - 2.5
162	Angola	1.9	5	1.8 - 1.9
162	Congo Brazzaville	1.9	5	1.6 - 2.1
162	Democratic Republic of Congo	1.9	5	1.7 - 2.1
162	Guinea-Bissau	1.9	3	1.8 - 2.0
162	Kyrgyzstan	1.9	7	1.8 - 2.1
162	Venezuela	1.9	7	1.8 - 2.0
168	Burundi	1.8	6	1.6 - 2.0
168	Equatorial Guinea	1.8	3	1.6 - 1.9
168	Guinea	1.8	5	1.7 - 1.8
168	Haiti	1.8	3	1.4 - 2.3
168	Iran	1.8	3	1.7 - 1.9

168	Turkmenistan	1.8	4	1.7 - 1.9
174	Uzbekistan	1.7	6	1.5 - 1.8
175	Chad	1.6	6	1.5 - 1.7
176	Iraq	1.5	3	1.2 - 1.8
176	Sudan	1.5	5	1.4 - 1.7
178	Myanmar	1.4	3	0.9 - 1.8
179	Afghanistan	1.3	4	1.0 - 1.5
180	Somalia	1.1	3	0.9 - 1.4

#### Methodology:

As noted above, the highest (and best) level of transparency with the least perceived corruption is indicated by the number, 10. The lower (and worse) levels of transparency are indicated by lower numbers.

According to Transparency International, the [Corruption Perceptions Index](#) (CPI) table shows a country's ranking and score, the number of surveys used to determine the score, and the confidence range of the scoring.

The rank shows how one country compares to others included in the index. The CPI score indicates the perceived level of public-sector corruption in a country/territory.

The CPI is based on 13 independent surveys. However, not all surveys include all countries. The surveys used column indicates how many surveys were relied upon to determine the score for that country.

The confidence range indicates the reliability of the CPI scores and tells us that allowing for a margin of error, we can be 90% confident that the true score for this country lies within this range.

Note:

Kosovo, which separated from the Yugoslav successor state of [Serbia](#), is not listed above. No calculation is available for [Kosovo](#) at this time, however, a future corruption index by Transparency International may include the world's newest country in its tally. Taiwan has been listed above despite its contested status; while Taiwan claims sovereign status, [China](#) claims ultimate jurisdiction over Taiwan. Hong Kong, which is also under the rubric of Chinese sovereignty, is listed above. Note as well that Puerto Rico, which is a [United States](#) domain, is also included in the list above. These inclusions likely have to do with the size and fairly autonomous status of their economies.

## Competitiveness Ranking

### Competitiveness Ranking

Editor's Note:

The Global Competitiveness Report's competitiveness ranking is based on the Global Competitiveness Index (GCI), which was developed for the World Economic Forum. The GCI is based on a number of competitiveness considerations, and provides a comprehensive picture of the competitiveness landscape in countries around the world. The competitiveness considerations are: institutions, infrastructure, macroeconomic environment, health and primary education, higher education and training, goods market efficiency, labour market efficiency, financial market development, technological readiness, market size, business sophistication, and innovation. The rankings are calculated from both publicly available data and the Executive Opinion Survey.

Country/Economy	GCI 2010 Rank	GCI 2010 Score	GCI 2009 Rank	Change 2009-2010
-----------------	------------------	-------------------	------------------	---------------------

Switzerland	1	5.63	1	0
Sweden	2	5.56	4	2
Singapore	3	5.48	3	0
United States	4	5.43	2	-2
Germany	5	5.39	7	2
Japan	6	5.37	8	2
Finland	7	5.37	6	-1
Netherlands	8	5.33	10	2
Denmark	9	5.32	5	-4
Canada	10	5.30	9	-1

Burundi	137	2.96	133	-4
Angola	138	2.93	n/a	n/a
Chad	139	2.73	131	-8

#### Methodology:

The competitiveness rankings are calculated from both publicly available data and the Executive Opinion Survey, a comprehensive annual survey conducted by the World Economic Forum together with its network of Partner Institutes (leading research institutes and business organizations) in the countries covered by the Report.

Highlights according to WEF --

- The [United States](#) falls two places to fourth position, overtaken by [Sweden](#) and [Singapore](#) in the rankings of the World Economic Forum's Global Competitiveness Report 2010-2011
- The People's Republic of [China](#) continues to move up the rankings, with marked improvements in several other Asian countries
- [Germany](#) moves up two places to fifth place, leading the Eurozone countries
- [Switzerland](#) tops the rankings

---

## **Taxation**

### Corporate income tax

Corporate income tax is applied at a rate of 30 percent on taxable income.

### Social security

Social security contributions are applied at a rate of five percent on gross salaries.

### Sales tax

A sales tax of 10 percent applied to sales transactions.

---

## **Stock Market**

The Eastern Caribbean Central Bank (ECCB) established the Eastern Caribbean Securities Exchange (ECSE) as a regional stock exchange, serving Anguilla, Antigua and Barbuda, Dominica, Grenada, Montserrat, Saint Kitts and Nevis, Saint Lucia, and Saint Vincent and the Grenadines. The ECSE is headquartered in St. Kitts and Nevis.

# **Chapter 5**

## **Social Overview**

---

## People

### **Background**

Grenada is a tiny nation, made up of its namesake main island and two other inhabited islands, Carriacou and Petit Martinique, which are much smaller still. It lies near the southern end of the Caribbean Sea's vast complex of islands, about 100 km north of Venezuela. The only significant Caribbean islands south of Grenada are Trinidad and Tobago.

Spanish mariners in the early 16<sup>th</sup> century named the island Granada after the city in Spain; the name used today, Grenada, is a French variant dating from the active French presence in the region in the 17<sup>th</sup> and 18<sup>th</sup> centuries.

Today, Grenada is one of the world's leading producers of nutmeg and a major grower of many other spices—a distinction that has given it the nickname "the Spice Island." It became much more widely known worldwide after it was the site of a United States military invasion in 1983.

Its landscape features mountains, lush rainforests, waterfalls and, on the coast, some outstanding beaches. Some consider Grenada's capital city of St. George's and its harbor setting the most picturesque urban scene in the Caribbean.

### **Demography**

The population of Grenada numbers just over 101,000. The vast majority are of African or mixed African-European descent. There are small minorities of European (mostly British) and East Asian descent, as well as a small community of indigenous Amerindians.

English is the official language; with only a few people still speaking a French-African patois that is a relic of Grenada's distant French colonial past.

A more significant reminder of Grenada's historical link with France is the strength of the Roman Catholic Church, to which about 60 percent of Grenadines belong. The Anglican Church is the largest Protestant denomination; other Protestant denominations with Grenadian adherents include

Methodist and Presbyterian.

### **Health and Welfare**

In terms of human development, education in Grenada is compulsory up to age sixteen. School attendance is high; most people in the country continue their education beyond the compulsory threshold, and the literacy rate is an impressive 96 percent.

According to recent estimates, the infant mortality rate is 13.92 deaths for every 1,000 live births. Average life expectancy of approximately 65 years of age. The fertility rate is 2.3 children born per woman. The birth rate is 21.87 births per 1,000 of the population and the death rate is 6.61 per 1,000 of the population.

About 4.9 percent of GDP is spent on education in this country; about 7.1 percent of GDP is spent on health expenditures. Access to water and sanitation is regarded as good although there may be some limits in certain rural areas.

### **Human Development**

Another quality-of-life indicator that reflects on Grenada is the Human Development Index (HDI), compiled annually since 1990 by the United Nations Development Programme (UNDP). The HDI is a composite of several indicators, which measure a country's achievements in three main arenas of human development: longevity, knowledge and education, as well as economic standard of living. In a recent ranking of 177 countries, the HDI placed Grenada in the medium human development category, at 82nd place. However, in the latest HDI update, Grenada was omitted.

Note: Although the concept of human development is complicated and cannot be properly captured by values and indices, the HDI, which is calculated and updated annually, offers a wide-ranging assessment of human development in certain countries, not based solely upon traditional economic and financial indicators.

## **Life Satisfaction Index**

### Life Satisfaction Index

### **Life Satisfaction Index**

Created by Adrian G. White, an Analytic Social Psychologist at the University of Leicester, the "Satisfaction with Life Index" measures subjective life satisfaction across various countries. The data was taken from a metastudy (see below for source) and associates the notion of subjective

happiness or life satisfaction with qualitative parameters such as health, wealth, and access to basic education. This assessment serves as an alternative to other measures of happiness that tend to rely on traditional and quantitative measures of policy on quality of life, such as GNP and GDP. The methodology involved the responses of 80,000 people across the globe.

178	Burundi	100

#### Commentary:

European countries, such as [Denmark](#), [Iceland](#), [Finland](#), [Sweden](#), [Switzerland](#), [Austria](#) resided at the top of the ranking with highest levels of self-reported life satisfaction. Conversely, European countries such as [Latvia](#), [Lithuania](#), [Moldova](#), [Belarus](#) and [Ukraine](#) ranked low on the index. African countries such as Democratic Republic of Congo, [Zimbabwe](#) and [Burundi](#) found themselves at the very bottom of the ranking, and indeed, very few African countries could be found in the top 100. [Japan](#) was at the mid-way point in the ranking, however, other Asian countries such as [Brunei](#) and [Malaysia](#) were in the top tier, while [Pakistan](#) was close to the bottom with a low level of self-identified life satisfaction. As a region, the Middle East presented a mixed bag with Saudi Arabians reporting healthy levels of life satisfaction and Egyptians near the bottom of the ranking. As a region, Caribbean countries were ranked highly, consistently demonstrating high levels of life satisfaction. The findings showed that health was the most crucial determining factor in life satisfaction, followed by prosperity and education.

### **Happy Planet Index**

## Happy Planet Index

The Happy Planet Index (HPI) is used to measure human well-being in conjunction with environmental impact. The HPI has been compiled since 2006 by the New Economics Foundation. The index is a composite of several indicators including subjective life satisfaction, life expectancy at birth, and ecological footprint per capita.

As noted by NEFA, the HPI "reveals the ecological efficiency with which human well-being is delivered." Indeed, the index combines environmental impact with human well-being to measure the environmental efficiency with which, country by country, people live long and happy lives. The countries ranked highest by the HPI are not necessarily the ones with the happiest people overall, but the ones that allow their citizens to live long and fulfilling lives, without negatively impacting this opportunity for either future generations or citizens of other countries. Accordingly, a country like the [United States](#) will rank low on this list due to its large per capital ecological footprint, which uses more than its fair share of resources, and will likely cause planetary damage.

It should be noted that the HPI was designed to be a counterpoint to other well-established indices of countries' development, such as Gross Domestic Product (GDP), which measures overall national wealth and economic development, but often obfuscates the realities of countries with stark variances between the rich and the poor. Moreover, the objective of most of the world's people is not to be wealthy but to be happy. The HPI also differs from the [Human Development Index](#) (HDI), which measures quality of life but not ecology, since it [HPI] also includes sustainability as a key indicator.

\*The Gender Development Index (GDI) is a composite index which measures the average achievement in a country. While very similar to the Human Development Index in its use of the

same variables, the GDI adjusts the average achievement of each country in terms of life expectancy, enrollment in schools, income, and literacy in accordance to the disparities between males and females.

\*The Gender Empowerment Measure (GEM) is a composite index measuring gender inequality in three of the basic dimensions of empowerment; economic participation and decision-making, political participation and decision-making, and power over economic resources.

\*Total Fertility Rate (TFR) is defined as the average number of babies born to women during their reproductive years. A TFR of 2.1 is considered the replacement rate; once a TFR of a population reaches 2.1 the population will remain stable assuming no immigration or emigration takes place. When the TFR is greater than 2.1 a population will increase and when it is less than 2.1 a population will eventually decrease, although due to the age structure of a population it will take years before a low TFR is translated into lower population.

\*Maternal Mortality Rate is the number of deaths to women per 100,000 live births that resulted from conditions related to pregnancy and or delivery related complications.

\*Economically Active Females are the share of the female population, ages 15 and above, whom supply, or are able to supply, labor for the production of goods and services.

\*Female Contributing Family Workers are those females who work without pay in an economic enterprise operated by a relative living in the same household.

\*Estimated Earned Income is measured according to Purchasing Power Parity (PPP) in US dollars.

## Global Gender Gap Index

### Global Gender Gap Index

#### Editor's Note:

The Global Gender Gap Index by the World Economic Forum ranks most of the world's countries in terms of the division of resources and opportunities among males and females. Specifically, the ranking assesses the gender inequality gap in these four arenas:

1. Economic participation and opportunity (salaries and high skilled employment participation levels)
2. Educational attainment (access to basic and higher level education)
3. Political empowerment (representation in decision-making structures)
4. Health and survival (life expectancy and sex ratio)

\*new country 2010

#### Commentary:

According to the report's index, Nordic countries, such as [Iceland](#), [Norway](#), [Finland](#), and [Sweden](#) have continued to dominate at the top of the ranking for gender equality. Meanwhile, [France](#) has seen a notable decline in the ranking, largely as a result of decreased number of women holding ministerial portfolios in that country. In the Americas, the [United States](#) has risen in the ranking to top the region, predominantly as a result of a decreasing wage gap, as well as higher number of women holding key positions in the current Obama administration. [Canada](#) has continued to remain as one of the top ranking countries of the Americas, followed by the small Caribbean island nation of Trinidad and Tobago, which has the distinction of being among the top three countries of the Americans in the realm of gender equality. [Lesotho](#) and South African ranked highly in the index, leading not only among African countries but also in global context. Despite [Lesotho](#) still lagging in the area of life expectancy, its high ranking was attributed to high levels of female participation in the labor force and female literacy. The [Philippines](#) and [Sri Lanka](#) were the top ranking countries for gender equality for Asia, ranking highly also in global context. The [Philippines](#) has continued to show strong performance in all strong performance on all four dimensions (detailed above) of the index. Finally, in the Arab world, the [United Arab Emirates](#)

held the highest-rank within that region of the world; however, its placement near the bottom of the global list highlights the fact that Arab countries are generally poor performers when it comes to the matter of gender equality in global scope.

## Culture and Arts

### Culture

Grenadian culture is a mixture of British, French, and African influences. As mentioned earlier, Roman Catholicism as well as a French-African patois are a cultural legacy from the period of French rule. Nevertheless, in comparison with several neighboring islands, French influences are rather slight. Likewise, use of the English language and a largely British physical and political infrastructure stem from Grenada's long-term status as a British colony from the 1780s to the 1970s. Yet, in keeping with the ethnic and cultural heritage of the great majority of Grenada's people, the island's human ambiance is predominantly African-Creole in character.

### Arts

During Carnival celebrations, the African-Creole aspects of the culture, in the form of steel band and calypso music from neighboring Trinidad and Tobago, are evident. In addition, the popularity of African names, dress, and other accoutrements of identity suggest a sort of Afrocentric cultural

revitalization. For instance, the island of Carriacou is home to a distinctive African folk group that plays goatskin-covered drums to accompany traditional West African dance presentations. Carriacou has also attracted international notice for a local artist, Canute Caliste, whose paintings offer fascinating marine depictions of his home in L'Esterre.

---

## Etiquette

### Cultural "dos and taboos"

1. A handshake is an appropriate form of greeting. Close friends and relatives will often embrace and kiss each other on the cheeks as they greet each other.
2. Good topics of conversation include sports, travel, family, culture and international politics.
3. People generally nod or politely greet one another as they pass in streets and in hallways. Handshakes among business associates is customary, while cross-gender cheek kissing is normative in social and familial settings. Indeed, cross-gender cheek kissing is a traditional greeting for business associates and acquaintances, as well as friends and family in social environments. The Americanized "hug" is reserved for highly emotive and special moments, as a gesture of close relations between the "huggers."
4. More formalized forms of address is customary in this country. Titles or insignias denoting authority or rank, such as "Professor," "Minister," "Doctor," or "Mr." And "Mrs.," are almost always used, unless explicitly invited to do otherwise. Among friends, somewhat more familiarity is employed so that children of friends or associates do not refer to their parents' cohorts as "Mr." or "Mrs.," but rather, as Aunt or Uncle, whether or not there is a familial connection. While locals are cognizant of the Americanized tendency to use first names freely (i.e. "*Just call me Frank*"), the local conventions remain somewhat more formalized and traditional.
5. The same sort of attention to authority and designations is also attributable to written correspondence. Letters, faxes and emails must adhere to the strictest standards of tradition, even if personal relations may be more relaxed.
6. Most of the North American hand and facial gestures will be understood.

7. Elbows on tables, feet on furniture (or anywhere other than the floor), are considered inappropriate reflections of "para-language" (or non-verbal communication).
8. Dining is Continental style with the fork steadfastly in the left hand and the knife in the right hand. Elbows should remain off the table and flatware should be placed in the four o'clock position when eating is finished.
9. When invited to someone's home, it is customary to take a gift. Flowers to the wife of a business associate and quality liquor to one's cohort are suggested gifts. Rum is plentiful here, making a bottle of imported vintage wine, sherry or port preferable.
10. Dress appropriately; although casual self-presentation is customary in the Caribbean, slovenly dress, a lack of footwear in public places, walking in public without a shirt, and beach apparel in any venue other than on the beach, is considered to be in very poor taste.

---

## Travel Information

**Please Note:** This is a generalized travel guide and it is intended to coalesce several resources, which a traveler might find useful, regardless of a particular destination. As such, it does not include travel warnings for specific "hot spot" destinations.

**For travel alerts and warnings, please see the United States Department of State's listings available at URL:**

**<http://travel.state.gov/content/passports/english/alertswarnings.html>**

**Please note that travel to the following countries, based on these warnings, is ill-advised, or**

---

**should be undertaken with the utmost precaution:**

**Afghanistan, Algeria, Burundi, Cameroon, Central African Republic, Chad, Colombia, Democratic Republic of Congo, Djibouti, El Salvador, Eritrea, Ethiopia, Guinea, Honduras, Iraq, Iran, Lebanon, Liberia, Libya, Mali, Mauritania, Mexico, Nepal, Niger, Nigeria, North Korea, Pakistan, Palestinian Territories of West Bank and Gaza, Philippines areas of Sulu Archipelago, Mindanao, and southern Sulu Sea, Saudi Arabia, Sierra Leone, Somalia, South Sudan, Sudan, Syria, Ukraine, Venezuela, and Yemen.**

## **International Travel Guide**

### **Checklist for Travelers**

1. Take out travel insurance to cover hospital treatment or medical evacuation. Overseas medical costs are expensive to most international travelers, where one's domestic, nationalized or even private health insurance plans will not provide coverage outside one's home country. Learn about "reciprocal insurance plans" that some international health care companies might offer.
2. Make sure that one's travel insurance is appropriate. If one intends to indulge in adventurous activities, such as parasailing, one should be sure that one is fully insured in such cases. Many traditional insurance policies do not provide coverage in cases of extreme circumstances.
3. Take time to learn about one's destination country and culture. Read and learn about the place one is traveling. Also check political, economic and socio-cultural developments at the destination by reading country-specific travel reports and fact sheets noted below.
4. Get the necessary visas for the country (or countries) one intends to visit - but be aware that a visa does not guarantee entry. A number of useful sites regarding visa and other entry requirements are noted below.
5. Keep in regular contact with friends and relatives back at home by phone or email, and be sure to leave a travel itinerary.
6. Protect one's personal information by making copies of one's passport details, insurance policy, travelers checks and credit card numbers. Taking copies of such documents with you, while leaving another collection copies with someone at home is also good practice for travelers. Taking copies of one's passport photograph is also recommended.
7. Stay healthy by taking all possible precautions against illness. Also, be sure to take extra supplies of prescription drugs along for the trip, while also taking time to pack general pharmaceutical supplies, such as aspirin and other such painkillers, bandages, stomach ailment medication, anti-inflammatory medication and anti-bacterial medication.
8. Do not carry illicit drugs. Understand that the punishment for possession or use of illegal drugs in some countries may be capital punishment. Make sure your prescription drugs are legal in the

countries you plan to visit.

**9.** Know the laws of one's destination country and culture; be sure to understand the repercussions of breaking those laws and regulations. Often the transparency and freedoms of the juridical system at home is not consistent with that of one's destination country. Become aware of these complexities and subtleties before you travel.

**10.** For longer stays in a country, or where the security situation is volatile, one should register one's self and traveling companions at the local embassy or consulate of one's country of citizenship.

**11.** Women should take care to be prepared both culturally and practically for traveling in a different country and culture. One should be sure to take sufficient supplies of personal feminine products and prescription drugs. One should also learn about local cultural standards for women, including norms of dressing. Be aware that it is simply inappropriate and unsafe for women to travel alone in some countries, and take the necessary precautions to avoid risk-filled situations.

**12.** If one is traveling with small children, one should pack extra supplies, make arrangements with the travel carrier for proper seating that would adequately accommodate children, infants or toddlers. Note also that whether one is male or female, traveling with children means that one's hands are thus not free to carry luggage and bags. Be especially aware that this makes one vulnerable to pickpockets, thieves and other sorts of crime.

**13.** Make proper arrangements for accommodations, well in advance of one's arrival at a destination. Some countries have limited accommodation, while others may have culturally distinctive facilities. Learning about these practicalities before one travels will greatly aid the enjoyment of one's trip.

**14.** Travel with different forms of currency and money (cash, traveler's checks and credit cards) in anticipation that venues may not accept one or another form of money. Also, ensuring that one's financial resources are not contained in one location, or by one person (if one is traveling with others) can be a useful measure, in the event that one loses a wallet or purse.

**15.** Find out about transportation in the destination country. In some places, it might be advisable to hire a local driver or taxi guide for safety reasons, while in other countries, enjoying one's travel experience may well be enhanced by renting a vehicle and seeing the local sights and culture independently. Costs may also be prohibitive for either of these choices, so again, prior planning is suggested.

## **Tips for Travelers**

Grenada is a peaceful island. Terrorism and kidnappings are unknown. There are no extremist groups, areas of instability or organized crime within the island.

Street crime occurs occasionally in Grenada. Tourists have been victims of armed robbery in isolated areas, and thieves frequently steal passports, alien registration cards, and money. Muggings, purse-snatchings and other robberies may occur in areas near hotels, beaches and

restaurants, particularly after dark. Visitors should exercise appropriate caution when walking after dark, or rely on taxis. Valuables left unattended on beaches are subject to theft.

The loss or theft of a passport should be reported immediately to the local police and the nearest appropriate embassy or consulate.

Medical care is limited. Serious medical problems requiring hospitalization and/or medical evacuation back to your country can cost thousands of dollars or more. Doctors and hospitals often expect immediate cash payment for health services. Pharmacies are well stocked, and prescription medicine is available, but travelers are advised to bring with them sufficient prescription medicine for their length of stay.

Uninsured travelers who require medical care overseas may face extreme difficulties. Please check with your own insurance company to confirm whether your policy applies overseas, including provision for medical evacuation. Please ascertain whether payment will be made to the overseas hospital or doctor or whether you will be reimbursed later for expenses that you incur. Some insurance policies also include coverage for psychiatric treatment and for disposition of remains in the event of death.

While in a foreign country, you may encounter road conditions that differ significantly from those in your country. The information below concerning Grenada is provided for general reference only, and may not be totally accurate in a particular location or circumstance.

Safety of Public Transportation: Good  
Urban Road Conditions/Maintenance: Fair  
Rural Road Conditions/Maintenance: Fair  
Availability of Roadside Assistance: Good

Traffic moves on the left in Grenada; therefore, the majority of vehicles are right-hand drive. Grenada's system of paved and unpaved roads (approx. 575 miles) consists of mostly narrow, winding roads. Road surfaces often deteriorate, particularly in the rainy season (June-November) before maintenance work begins. Grenada's road conditions, increasing numbers of vehicles, and sometimes-undisciplined minibus drivers (who provide public and for-hire transport) all oblige caution and reduced speed for safety.

Grenada customs authorities may enforce strict regulations concerning temporary importation into or export from Grenada of items such as firearms, antiquities, business equipment, fruits and vegetables, electronics, and archaeological items.

While in a foreign country, you are subject to that country's laws and regulations. Persons violating Grenada laws, even unknowingly, may be expelled, arrested or imprisoned. Penalties for

possession, use, or trafficking in illegal drugs in Grenada are strict, and convicted offenders can expect jail sentences and heavy fines.

It is difficult to cash personal checks in Grenada, and, if accepted, these will take approximately six weeks to clear by a local bank. Major credit cards are widely accepted, and ATM facilities are available at most banks.

Grenada has experienced tropical storms during the hurricane season, from June through November.

## **Diseases/Health Data**

**Please Note: Most of the entry below constitutes a generalized health advisory, which a traveler might find useful, regardless of a particular destination.**

**As a supplement, however, reader will also find below a list of countries flagged with current health notices and alerts issued by the Centers for Disease Control and Prevention (CDC).**

**Please note that travel to the following countries, based on these 3 levels of warnings, is ill-advised, or should be undertaken with the utmost precaution:**

**Level 3 (highest level of concern; avoid non-essential travel) --**

**Guinea - Ebola**

**Liberia - Ebola**

**Nepal - Earthquake zone**

**Sierra Leone - Ebola**

**Level 2 (intermediate level of concern; use utmost caution during travel) --**

**Cameroon - Polio**

**Somalia - Polio**

**Vanuatu - Tropical Cyclone zone**

**Throughout Middle East and Arabia Peninsula - MERS ((Middle East Respiratory Syndrome)**

**Level 1 (standard level of concern; use practical caution during travel) -**

**Australia - Ross River disease**

**Bosnia-Herzegovina - Measles**

**Brazil - Dengue Fever**

**Brazil - Malaria**

**Brazil - Zika**

**China - H7N9 Avian flu**

**Cuba - Cholera**

**Egypt - H5N1 Bird flu**

**Ethiopia - Measles**

**Germany - Measles**

**Japan - Hand, foot, and mouth disease (HFMD)**

**Kyrgyzstan - Measles**  
**Malaysia -Dengue Fever**  
**Mexico - Chikungunya**  
**Mexico - Hepatitis A**  
**Nigeria - Meningitis**  
**Philippines - Measles**  
**Scotland - Mumps**  
**Singapore - Hand, foot, and mouth disease (HFMD)**  
**South Korea - MERS ((Middle East Respiratory Syndrome)**  
**Throughout Caribbean - Chikungunya**  
**Throughout Central America - Chikungunya**  
**Throughout South America - Chikungunya**  
**Throughout Pacific Islands - Chikungunya**

**For specific information related to these health notices and alerts please see the CDC's listing available at URL:**  
**<http://wwwnc.cdc.gov/travel/notices>**

### **Health Information for Travelers to Grenada**

The preventive measures you need to take while traveling in the Caribbean depend on the areas you visit and the length of time you stay. You should observe the precautions listed in this document in most areas of this region.

Travelers' diarrhea, the number one illness in travelers, can be caused by viruses, bacteria, or parasites, which can contaminate food or water. Infections may cause diarrhea and vomiting (*E. coli*, *Salmonella*, cholera, and parasites), fever (typhoid fever and toxoplasmosis), or liver damage (hepatitis). Make sure your food and drinking water are safe. (See below.)

Malaria is a preventable infection that can be fatal if left untreated. Prevent infection by taking prescription antimalarial drugs and protecting yourself against mosquito bites (see below). Risk for malaria is high all year in all areas of Haiti and in rural areas of the Dominican Republic, especially areas bordering Haiti.

You are not at risk if you travel only to other Caribbean islands. Travelers to Haiti and rural Dominican Republic should take chloroquine to prevent malaria. For more information about detailed locations, see *Malaria in the Caribbean* (<http://www.cdc.gov/travel/regionalmalaria/caribbean.htm>).

A certificate of yellow fever vaccination may be required for entry into certain areas of these

countries if you are arriving from a tropical South American or sub-Saharan African country. For detailed information, see Comprehensive Yellow Fever Vaccination Requirements (<http://www.cdc.gov/travel/yelfever.htm>).

Dengue, filariasis, and leishmaniasis are diseases carried by insects that also occur in this region. Protecting yourself against insect bites (see below) will help to prevent these diseases.

Schistosomiasis, a parasitic infection, is found in fresh water in parts of Antigua, the Dominican Republic, Guadeloupe, Martinique, Montserrat, Puerto Rico, and St. Lucia. Do not swim in fresh water (except in well-chlorinated swimming pools) in these countries. (For more information, please see the Swimming Precautions on the Making Travel Safe page at URL <http://www.cdc.gov/travel/safety.htm>.)

### **CDC Recommends the Following Vaccines (as Appropriate for Age):**

See your doctor at least 4-6 weeks before your trip to allow time for shots to take effect.

- Hepatitis A or immune globulin (IG) should be considered if travel to areas of questionable sanitation is anticipated.
- Hepatitis B, if you might be exposed to blood (for example, health-care workers) or travelers who have sexual contact with the local population, stay longer than 6 months in Haiti or the Dominican Republic, or might be exposed through medical treatment.
- Rabies, if you might be exposed to wild or domestic animals through your work or recreation.
- Typhoid, particularly if you are visiting developing countries in this region.
- Yellow fever, for travelers going outside urban areas in Trinidad and Tobago.
- As needed, booster doses for tetanus-diphtheria and measles. Hepatitis B vaccine is now recommended for all infants and for children ages 11-12 years who did not receive the series as infants.

### **All travelers should take the following precautions, no matter the destination:**

- Wash hands often with soap and water.
- Because motor vehicle crashes are a leading cause of injury among travelers, walk and drive defensively. Avoid travel at night if possible and always use seat belts.
- Always use latex condoms to reduce the risk of HIV and other sexually transmitted diseases.
- Don't eat or drink dairy products unless you know they have been pasteurized.
- Don't share needles with anyone.
- Eat only thoroughly cooked food or fruits and vegetables you have peeled yourself. Remember: boil it, cook it, peel it, or forget it.
- Never eat undercooked ground beef and poultry, raw eggs, and unpasteurized dairy products. Raw shellfish is particularly dangerous to persons who have liver disease or compromised immune systems.

**Travelers visiting undeveloped areas should take the following precautions:**

**To Stay Healthy, Do:**

- Drink only bottled or boiled water, or carbonated (bubbly) drinks in cans or bottles. Avoid tap water, fountain drinks, and ice cubes. If this is not possible, make water safer by BOTH filtering through an "absolute 1-micron or less" filter AND adding iodine tablets to the filtered water. "Absolute 1-micron filters" are found in camping/outdoor supply stores.
- If you visit an area where there is risk for malaria, take your malaria prevention medication before, during, and after travel, as directed. (See your doctor for a prescription.)
- Protect yourself from insects by remaining in well-screened areas, using repellents (applied sparingly at >4-hour intervals) and permethrin-impregnated mosquito nets, and wearing long-sleeved shirts and long pants from dusk through dawn.
- To prevent fungal and parasitic infections, keep feet clean and dry, and do not go barefoot.

**To Avoid Getting Sick:**

- Don't eat food purchased from street vendors.
- Don't drink beverages with ice.
- Don't handle animals (especially monkeys, dogs, and cats), to avoid bites and serious diseases (including rabies and plague). (For more information, please see the Animal-Associated Hazards on the Making Travel Safe page.)
- Don't swim in fresh water. Salt water is usually safer. (For more information, please see the Swimming Precautions on the Making Travel Safe page.)

**What You Need To Bring with You:**

- Long-sleeved shirt and long pants to wear whenever possible to prevent illnesses carried by insects (e.g., malaria, dengue, and leishmaniasis).
- Insect repellent containing DEET (diethylmethylnolamide), in 30%-35% strength for adults and 6%-10% for children. If you are not staying in air-conditioned or well-screened housing, you should purchase a bed net impregnated with the insecticide permethrin. (Bed nets can be purchased in camping or military supply stores.)
- Over-the-counter antidiarrheal medicine to take if you have diarrhea.
- Iodine tablets and portable water filters to purify water if bottled water is not available. See above for more detailed information about water filters.
- Sunblock, sunglasses, hat.
- Prescription medications: make sure you have enough to last during your trip, as well as a copy of the prescription(s).

### **After You Return Home:**

If you have visited an area where there is risk for malaria, continue taking your malaria medication weekly for 4 weeks after you leave the area.

If you become ill-even as long as a year after your return-tell your doctor where you have traveled.

### **For More Information:**

Ask your doctor or check the CDC web sites for information about how to protect yourself against diseases that occur in the Caribbean, such as:

#### **For information about diseases-**

Carried by Insects

Dengue, Malaria

Carried in Food or Water

*Escherichia coli*, diarrhea, Hepatitis A, Schistosomiasis, Typhoid Fever

Person-to-Person Contact

Hepatitis B, HIV/AIDS

For more information about these and other diseases, please check the Diseases (<http://www.cdc.gov/travel/diseases.htm>) section and the Health Topics A - Z (<http://www.cdc.gov/health/diseases.htm>).

*Note:*

*Grenada is located in the Caribbean health region.*

# **Chapter 6**

## **Environmental Overview**

---

## Environmental Issues

### General Overview:

Grenada 's environmental challenges appear to be consistent with those of many micro-states that are attempting to develop their economies.

### Current Issues:

- Soil erosion
- Beach and coastline erosion
- Waste management
- Water supply
- Water pollution
- Sedimentation of coastal and river waters
- Forestry and land protection
- Potential loss of habitat and associated bio-diversity

### Total Greenhouse Gas Emissions (Mtc):

0.0

### Country Rank (GHG output):

181st

### Natural Hazards:

- hurricanes

---

## Environmental Policy

### Regulation and Jurisdiction:

The regulation and protection of the environment in Grenada is under the jurisdiction of the following:

- Ministry of Health, and the Environment

### Major Non-Governmental Organizations:

N/A

### International Environmental Accords:

*Party to:*

- Biodiversity
- Climate Change
- Climate Change-Kyoto Protocol
- Desertification
- Endangered Species
- Law of the Sea
- Ozone Layer Protection
- Whaling

*Signed but not ratified:*

- None

*Kyoto Protocol Status (year ratified):*

2002

---

## Global Environmental Snapshot

### **Introduction**

The countries of the world face many environmental challenges in common. Nevertheless, the nature and intensity of problem vary from region to region, as do various countries' respective capacities, in terms of affluence and infrastructure, to remediate threats to environmental quality.

Consciousness of perils affecting the global environment came to the fore in the last third or so of the 20<sup>th</sup> century has continued to intensify well into the new millennium. According to the United Nations Environment Programme, considerable environmental progress has been made at the level of institutional developments, international cooperation accords, and public participation. Approximately two-dozen international environmental protection accords with global implications have been promulgated since the late 1970s under auspices of the United Nations and other international organizations, together with many additional regional agreements. Attempts to address and rectify environmental problems take the form of legal frameworks, economic instruments, environmentally sound technologies and cleaner production processes as well as conservation efforts. Environmental impact assessments have increasingly been applied across the globe.

Environmental degradation affects the quality, or aesthetics, of human life, but it also displays potential to undermine conditions necessary for the sustainability of human life. Attitudes toward the importance of environmental protection measures reflect ambivalence derived from this bifurcation. On one hand, steps such as cleaning up pollution, dedicating parkland, and suchlike, are seen as embellishments undertaken by wealthy societies already assured they can successfully perform those functions deemed, ostensibly, more essential-for instance, public health and education, employment and economic development. On the other hand, in poorer countries, activities causing environmental damage-for instance the land degradation effects of unregulated logging, slash-and-burn agriculture, overgrazing, and mining-can seem justified insofar as such activities provide incomes and livelihoods.

Rapid rates of resource depletion are associated with poverty and high population growth, themselves correlated, whereas consumption per capita is much higher in the most developed countries, despite these nations' recent progress in energy efficiency and conservation. It is impossible to sequester the global environmental challenge from related economic, social and political challenges.

First-tier industrialized countries have recently achieved measurable decreases in environmental pollution and the rate of resource depletion, a success not matched in middle income and developing countries. It is believed that the discrepancy is due to the fact that industrialized countries have more developed infrastructures to accommodate changes in environmental policy, to apply environmental technologies, and to invest in public education. The advanced industrialized countries incur relatively lower costs in alleviating environmental problems, in comparison to developing countries, since in the former even extensive environmental programs represent a rather minuscule percentage of total expenditures. Conversely, budget constraints, lagged provision of basic services to the population, and other factors such as debt service and militarization may preclude institution of minimal environmental protection measures in the poorest countries.

A synopsis for the current situation facing each region of the world follows:

### **Regional Synopsis: Africa**

The African continent, the world's second-largest landmass, encompasses many of the world's least developed countries. By global standards, urbanization is comparatively low but rising at a rapid rate. More heavily industrialized areas at the northern and southern ends of the continent experience the major share of industrial pollution. In other regions the most serious environmental problems typically stem from inefficient subsistence farming methods and other forms of land degradation, which have affected an increasingly extensive area under pressure of a widely impoverished, fast-growing population. Africa's distribution of natural resources is very uneven. It is the continent at greatest risk of desertification, especially in the Sahel region at the edge of the

Sahara but also in other dry-range areas. Yet at the same time, Africa also harbors some of the earth's richest and most diverse biological zones.

### Key Points:

Up to half a billion hectares of African land are moderately to severely degraded, an occurrence reflecting short-fallow shifting cultivation and overgrazing as well as a climatic pattern of recurrent droughts.

Soil degradation is severe along the expanse directly south of the Sahara, from the west to the east coasts. Parts of southern Africa, central-eastern Africa, and the neighboring island of Madagascar suffer from serious soil degradation as well.

Africa contains about 17 percent of the world's forest cover, concentrated in the tropical belt of the continent. Many of the forests, however, are severely depleted, with an estimated 70 percent showing some degree of degradation.

Population growth has resulted in continuing loss of arable land, as inefficient subsistence farming techniques affect increasingly extensive areas. Efforts to implement settled, sustainable agriculture have met with some recent success, but much further progress in this direction is needed. Especially in previously uninhabited forestlands, concern over deforestation is intensifying.

By contrast, the African savanna remains the richest grassland in the world, supporting a substantial concentration of animal and plant life. Wildlife parks are sub-Saharan Africa's greatest tourist attraction, and with proper management-giving local people a stake in conservation and controlling the pace of development-could greatly enhance African economies.

Significant numbers of mammal species in parts of northern, southern and eastern Africa are currently threatened, while the biological diversity in Mauritania and Madagascar is even further compromised with over 20 percent of the mammal species in these two countries currently under threat.

With marine catch trends increasing from 500,000 metric tons in the 1950s to over 3,000,000 metric tons by 2000, there was increasing concern about the reduction in fisheries and marine life, should this trend continue unabated.

Water resource vulnerability is a major concern in northeastern Africa, and a moderate concern across the rest of the continent. An exception is central Africa, which has plentiful water supplies.

Many Africans lack adequate access to resources, not just (if at all) because the resources are unevenly distributed geographically, but also through institutional failures such as faulty land tenure

systems or political upheaval. The quality of Africa's natural resources, despite their spotty distribution, is in fact extraordinarily rich. The infrastructure needed to protect and benefit from this natural legacy, however, is largely lacking.

### **Regional Synopsis: Asia and the Pacific**

Asia-earth's largest landmass-and the many large and nearly innumerable small islands lying off its Pacific shore display extraordinarily contrasting landscapes, levels of development, and degrees of environmental stress. In the classification used here, the world's smallest continent, Australia, is also included in the Asia-Pacific region.

The Asia-Pacific region is home to 9 of the world's 14 largest urban areas, and as energy use for utilities, industry and transport increases in developing economies, urban centers are subject to worsening air quality. Intense population density in places such as Bangladesh or Hong Kong is the quintessential image many people have of Asia, yet vast desert areas such as the Gobi and the world's highest mountain range, the Himalayas, span the continent as well. Forested areas in Southeast Asia and the islands of Indonesia and the Philippines were historically prized for their tropical hardwood, but in many places this resource is now severely depleted. Low-lying small island states are extremely vulnerable to the effects of global warming, both rising sea levels and an anticipated increase in cyclones.

#### **Key Points:**

Asian timber reserves are forecast to be depleted in the next 40 years. Loss of natural forest is irreversible in some areas, but plantation programs to restore tree cover may ameliorate a portion of the resulting land degradation.

Increased usage of fossil fuels in China and other parts of southern Asia is projected to result in a marked increase in emissions, especially in regard to carbon dioxide. The increased usage of energy has led to a marked upsurge in air pollution across the region.

Acidification is an emerging problem regionally, with sulfur dioxide emissions expected to triple by 2010 if the current growth rate is sustained. China, Thailand, India, and Korea seem to be suffering from particularly high rates of acid deposition. By contrast, Asia's most highly developed economy, Japan, has effected substantial improvements in its environmental indicators.

Water pollution in the Pacific is an urgent concern since up to 70 percent of the water discharged into the region's waters receives no treatment. Additionally, the disposal of solid wastes, in like manner, poses a major threat in a region with many areas of high population density.

The Asia-Pacific region is the largest expanse of the world's land that is adversely affected by soil degradation.

The region around Australia reportedly suffers the largest degree of ozone depletion.

The microstates of the Pacific suffer land loss due to global warming, and the consequent rise in the levels of ocean waters. A high-emissions scenario and anthropogenic climate impact at the upper end of the currently predicted range would probably force complete evacuation of the lowest-elevation islands sometime in this century.

The species-rich reefs surrounding Southeast Asia are highly vulnerable to the deleterious effects of coastal development, land-based pollution, over-fishing and exploitative fishing methods, as well as marine pollution from oil spills and other activities.

With marine catch trends increasing from 5,000,000 metric tons in the 1950s to over 20,000,000 metric tons by 2000, there was increasing concern about the reduction in fisheries and marine life, should this trend continue unabated.

Significant numbers of mammal species in parts of China and south-east Asia are currently threatened, while the biological diversity in India, Japan, Australia, the Philippines, Indonesia and parts of Malaysia is even further compromised with over 20 percent of the mammal species in these countries currently under threat.

Water resource vulnerability is a serious concern in areas surrounding the Indian subcontinent.

### **Regional Synopsis: Central Asia**

The Central Asian republics, formerly in the Soviet Union, experience a range of environmental problems as the result of poorly executed agricultural, industrial, and nuclear programs during the Soviet era. Relatively low population densities are the norm, especially since upon the breakup of the U.S.S.R. many ethnic Russians migrated back to European Russia. In this largely semi-arid region, drought, water shortages, and soil salinization pose major challenges.

#### **Key Points:**

The use of agricultural pesticides, such as DDT and other chemicals, has contributed to the contamination of soil and groundwater throughout the region.

Land and soil degradation, and in particular, increased salinization, is mostly attributable to faulty irrigation practices.

Significant desertification is also a problem in the region.

Air pollution is prevalent, mostly due to use of low octane automobile fuel.

Industrial pollution of the Caspian Sea and the Aral Sea, as a result of industrial effluents as well as mining and metal production, presents a challenge to the countries bordering these bodies of water.

One of the most severe environmental problems in the region is attributable to the several billion tons of hazardous materials stored in landfills across Central Asia.

Uzbekistan's particular problem involves the contraction of the Aral Sea, which has decreased in size by a third, as a consequence of river diversions and poor irrigation practices. The effect has been the near-total biological destruction of that body of water.

Kazakhstan, as a consequence of being the heartland of the former Soviet Union's nuclear program, has incurred a high of cancerous malignancies, biogenetic abnormalities and radioactive contamination.

While part of the Soviet Union, the republics in the region experienced very high levels of greenhouse gas emissions, as a consequence of rapid industrialization using cheap but dirty energy sources, especially coal.

By contrast, however, there have recently been substantial reductions in the level of greenhouse gas emissions, especially those attributable to coal burning, with further decreases anticipated over the next decade. These changes are partially due to the use of cleaner energy technologies, such as natural gas, augmented by governmental commitment to improving environmental standards.

### **Regional Synopsis: Europe**

Western Europe underwent dramatic transformation of its landscape, virtually eliminating large-scale natural areas, during an era of rapid industrialization, which intensified upon its recovery from World War II. In Eastern Europe and European Russia, intensive land development has been less prevalent, so that some native forests and other natural areas remain. Air and water pollution from use of dirty fuels and industrial effluents, however, are more serious environmental problems in Eastern than in Western Europe, though recent trends show improvement in many indicators. Acid rain has inflicted heavy environmental damage across much of Europe, particularly on forests. Europe and North America are the only regions in which water usage for industry exceeds that for agriculture, although in Mediterranean nations agriculture is the largest water consumer.

Key Points:

Europe contributes 36 percent of the world's chlorofluorocarbon emissions, 30 percent of carbon dioxide emissions, and 25 percent of sulfur dioxide emissions.

Sulfur and nitrogen oxide emissions are the cause of 30 to 50 percent of Central and Eastern Europe's deforestation.

Acid rain has been an environmental concern for decades and continues to be a challenge in parts of Western Europe.

Overexploitation of up to 60 percent of Europe's groundwater presents a problem in industrial and urban areas.

With marine catch trends increasing from 5,000,000 metric tons in the 1950s to over 20,000,000 metric tons by 2000, there was increasing concern about the reduction in fisheries and marine life, should this trend continue unabated.

Significant numbers of mammal species in parts of western Europe, Eastern Europe and Russia are currently threatened, while the biological diversity on the Iberian Peninsula is even further compromised with over 40 percent of the mammal species in this region currently under threat. As a result, there has been a 10 percent increase in protected areas of Europe.

A major environmental issue for Europe involves the depletion of various already endangered or threatened species, and most significantly, the decline of fish stocks. Some estimates suggest that up to 50 percent of the continent's fish species may be considered endangered species. Coastal fisheries have been over-harvested, resulting in catch limits or moratoriums on many commercially important fish species.

Fortunately, in the last few years, these policies have started to yield measurable results with decreasing trends in marine fish catch.

Recently, most European countries have adopted cleaner production technologies, and alternative methods of waste disposal, including recycling.

The countries of Eastern Europe have made air quality a major environmental priority. This is exemplified by the Russian Federation's addition to the 1995 "Berlin Mandate" (transnational legislation based on resolutions of the Rio Earth Summit) compelling nations to promote "carbon sinks" to absorb greenhouse gases.

On a relative basis, when compared with the degree of industrial emissions emitted by many

Eastern European countries until the late 1980s, there has been some marked increase in air quality in the region, as obsolete plants are closed and a transition to cleaner fuels and more efficient energy use takes place.

### **Regional Synopsis: The Middle and Near East**

Quite possibly, the Middle East will exemplify the adage that, as the 20<sup>th</sup> century was a century fixated on oil, the 21<sup>st</sup> century will be devoted to critical decisions about water. Many (though far from all) nations in the Middle East rank among those countries with the largest oil and gas reserves, but water resources are relatively scarce throughout this predominantly dry region. Effects of global warming may cause moderately high elevation areas that now typically receive winter "snowpack" to experience mainly rain instead, which would further constrain dry-season water availability. The antiquities and religious shrines of the region render it a great magnet for tourism, which entails considerable economic growth potential but also intensifies stresses on the environment.

#### **Key Points:**

Water resource vulnerability is a serious concern across the entire region. The increased usage of, and further demand for water, has exacerbated long-standing water scarcity in the region. For instance, river diversions and industrial salt works have caused the Dead Sea to shrink by one-third from its original surface area, with further declines expected.

The oil industry in the region contributes to water pollution in the Persian Gulf, as a result of oil spills, which have averaged 1.2 million barrels of oil spilt per year (some sources suggest that this figure is understated). The consequences are severe because even after oil spills have been cleaned up, environmental damage to the food webs and ecosystems of marine life will persist for a prolonged period.

The region's coastal zone is considered one of the most fragile and endangered ecosystems of the world. Land reclamation, shoreline construction, discharge of industrial effluents, and tourism (such as diving in the Red Sea) contribute to widespread coastal damage.

Significant numbers of mammal species in parts of the Middle East are currently threatened.

Since the 1980s, 11 percent of the region's natural forest has been depleted.

### **Regional Synopsis: Latin America and the Caribbean**

The Latin American and Caribbean region is characterized by exceedingly diverse landforms that have generally seen high rates of population growth and economic development in recent decades. The percentage of inhabitants residing in urban areas is quite high at 73.4 percent; the region includes the megacities of Mexico City, Sao Paulo, and Rio de Janeiro. The region also includes the world's second-highest mountain range, the Andes; significant expanses of desert and grassland; the coral reefs of the Caribbean Sea; and the world's largest contiguous tropical forest in the Amazon basin. Threats to the latter from subsistence and commercial farming, mineral exploitation and timbering are well publicized. Nevertheless, of eight countries worldwide that still retain at least 70 percent of their original forest cover, six are in Latin America. The region accounts for nearly half (48.3 percent) of the world's greenhouse gas emissions derived from land clearing, but as yet a comparatively minuscule share (4.3 percent) of such gases from industrial sources.

#### Key Points:

Although Latin America is one of the most biologically diverse regions of the world, this biodiversity is highly threatened, as exemplified by the projected extinction of up to 100,000 species in the next few decades. Much of this loss will be concentrated in the Amazon area, although the western coastline of South America will also suffer significant depletion of biological diversity. The inventory of rainforest species with potentially useful commercial or medical applications is incomplete, but presumed to include significant numbers of such species that may become extinct before they are discovered and identified.

Up to 50 percent of the region's grazing land has lost its soil fertility as a result of soil erosion, salinization, alkalinization and overgrazing.

The Caribbean Sea, the Atlantic Ocean, and the Pacific Ocean have all been contaminated by agricultural wastes, which are discharged into streams that flow into these major waters. Water pollution derived from phosphorous, nitrates and pesticides adversely affects fish stocks, contributes to oxygen depletion and fosters overgrowth of aquatic vegetation. Marine life will continue to be severely compromised as a result of these conditions.

Due to industrial development in the region, many beaches of eastern Latin America and the Caribbean suffer from tar deposits.

Most cities in the region lack adequate sewage treatment facilities, and rapid migration of the rural poor into the cities is widening the gap between current infrastructure capacity and the much greater level needed to provide satisfactory basic services.

The rainforest region of the Amazon Basin suffers from dangerously high levels of deforestation, which may be a significant contributory factor to global warming or "the greenhouse effect." In the

late 1990s and into the new millennium, the rate of deforestation was around 20 million acres of rainforest being destroyed annually.

Deforestation on the steep rainforest slopes of Caribbean islands contributes to soil erosion and landslides, both of which then result in heavy sedimentation of nearby river systems. When these sedimented rivers drain into the sea and coral reefs, they poison the coral tissues, which are vital to the maintenance of the reef ecosystem. The result is marine degradation and nutrient depletion. Jamaica's coral reefs have never quite recovered from the effects of marine degradation.

The Southern Cone of Latin America (Argentina, Brazil, Chile, Paraguay, and Uruguay) suffers the effects of greatly increased ultraviolet-B radiation, as a consequence of more intense ozone depletion in the southern hemisphere.

Water resource vulnerability is an increasingly major concern in the northwestern portion of South America.

### **Regional Synopsis: North America**

North American nations, in particular the United States and Canada, rank among the world's most highly developed industrial economies—a fact which has generated significant pollution problems, but also financial resources and skills that have enabled many problems to be corrected. Although efforts to promote energy efficiency, recycling, and suchlike have helped ease strains on the environment in a part of the world where per capita consumption levels are high, sprawling land development patterns and recent preferences many households have demonstrated for larger vehicles have offset these advances.

Meanwhile, a large portion of North America's original forest cover has been lost, though in many cases replaced by productive second-growth woodland. In recent years, attitudes toward best use of the region's remaining natural or scenic areas seem to be shifting toward recreation and preservation and away from resource extraction. With increasing attention on the energy scarcity in the United States, however, there is speculation that this shift may be short-lived. Indeed, the energy shortage on the west coast of the United States and associated calls for energy exploration, indicate a possible retrenchment toward resource extraction. At the same time, however, it has also served to highlight the need for energy conservation as well as alternative energy sources.

Despite generally successful anti-pollution efforts, various parts of the region continue to suffer significant air, water and land degradation from industrial, vehicular, and agricultural emissions and runoff. Mexico, as a middle-income country, displays environmental problems characteristic of a developing economy, including forest depletion, pollution from inefficient industrial processes and dirty fuels, and lack of sufficient waste-treatment infrastructure.

Key Points:

Because of significantly greater motor vehicle usage in the United States (U.S.) than in the rest of the world, the U.S. contribution of urban air pollution and greenhouse gas emissions, especially carbon dioxide, is disproportionately high in relation to its population.

Acid rain is an enduring issue of contention in the northeastern part of the United States, on the border with Canada.

Mexico's urban areas suffer extreme air pollution from carbon monoxide, nitrogen oxides, sulfur dioxide, and other toxic air pollutants. Emissions controls on vehicles are in their infancy, compared to analogous regulations in the U.S.

The cities of Mexico, including those on the U.S. border, also discharge large quantities of untreated or poorly treated sewage, though officials are currently planning infrastructure upgrades.

Deforestation is noteworthy in various regions of the U.S., especially along the northwest coastline. Old growth forests have been largely removed, but in the northeastern and upper midwestern sections of the United States, evidence suggests that the current extent of tree cover probably surpasses the figure for the beginning of the 20<sup>th</sup> century.

Extreme weather conditions in the last few years have resulted in a high level of soil erosion along the north coast of California; in addition, the coastline itself has shifted substantially due to soil erosion and concomitant landslides.

Agricultural pollution-including nitrate contamination of well water, nutrient runoff to waterways, and pesticide exposure-is significant in various areas. Noteworthy among affected places are California's Central Valley, extensive stretches of the Midwest, and land in the Chesapeake Bay watershed.

Inland waterways, especially around the Great Lakes, have substantially improved their water quality, due to concentrated efforts at reducing water pollution by governmental, commercial and community representatives. Strict curbs on industrial effluents and near-universal implementation of sewage treatment are the chief factors responsible for this improvement.

A major environmental issue for Canada and the United States involves the depletion of various already endangered or threatened species, and most significantly, the decline of fish stocks. Coastal fisheries have been over-harvested, resulting in catch limits or moratoriums on many commercially important fish species. In the last few years, these policies have started to yield measurable results

with decreasing trends in marine fish catch.

Due to the decay of neighboring ecosystems in Central America and the Caribbean, the sea surrounding Florida has become increasingly sedimented, contributing to marine degradation, nutrient depletion of the ecosystem, depletion of fish stocks, and diseases to coral species in particular.

## **Polar Regions**

### **Key Points:**

The significant rise in sea level, amounting 10 to 25 centimeters in the last 100 years, is due to the melting of the Arctic ice sheets, and is attributed to global warming.

The Antarctic suffers from a significant ozone hole, first detected in 1976. By 1985, a British scientific team reported a 40 percent decrease in usual regeneration rates of the ozone. Because a sustained increase in the amount of ultraviolet-B radiation would have adverse consequences upon all planetary life, recent environmental measures have been put into effect, aimed at reversing ozone depletion. These measures are projected to garner significant results by 2050.

Due to air and ocean currents, the Arctic is a sink for toxic releases originally discharged thousands of miles away. Arctic wildlife and Canada's Inuit population have higher bodily levels of contaminants such as PCB and dioxin than those found in people and animals in much of the rest of the world.

---

## **Global Environmental Concepts**

-

### **1. Global Warming and Greenhouse Gases**

#### **The Greenhouse Effect:**

In the early 19<sup>th</sup> century, the French physicist, Jean Fourier, contended that the earth's atmosphere functions in much the same way as the glass of a greenhouse, thus describing what is now understood as the "greenhouse effect." Put simply, the "greenhouse effect" confines some of the

sun's energy to the earth, preserving some of the planet's warmth, rather than allowing it to flow back into space. In so doing, all kinds of life forms can flourish on earth. Thus, the "greenhouse effect" is necessary to sustain and preserve life forms and ecosystems on earth.

In the late 19<sup>th</sup> century, a Swedish chemist, Svante Arrhenius, noticed that human activities, such as the burning of coal and other fossil fuels for heat, and the removal of forested lands for urban development, led to higher concentrations of greenhouse gases, like carbon dioxide and methane, in the atmosphere. This increase in the levels of greenhouse gases was believed to advance the "greenhouse effect" exponentially, and might be related to the trend in global warming.

In the wake of the Industrial Revolution, after industrial development took place on a large scale and the total human population burgeoned simultaneously with industrialization, the resulting increase in greenhouse gas emissions could, many scientists believe, be significant enough to have some bearing on climate. Indeed, many studies in recent years support the idea that there is a linkage between human activities and global warming, although there is less consensus on the extent to which this linkage may be relevant to environmental concerns.

That said, some scientists have argued that temperature fluctuations have existed throughout the evolution of the planet. Indeed, Dr. S. Fred Singer, the president of the Science and Environment Policy Project has noted that 3,000-year-old geological records of ocean sediment reveal changes in the surface temperature of the ocean. Hence, it is possible that climate variability is merely a normal fact of the planet's evolution. Yet even skeptics as to anthropogenic factors concur that any substantial changes in global temperatures would likely have an effect upon the earth's ecosystems, as well as the life forms that inhabit them.

### **The Relationship Between Global Warming and Greenhouse Gases:**

A large number of climatologists believe that the increase in atmospheric concentrations of "greenhouse gas emissions," mostly a consequence of human activities such as the burning of fossil fuels, are contributing to global warming. The cause notwithstanding, the planet has reportedly warmed 0.3°C to 0.6°C over the last century. Indeed, each year during the 1990s was one of the very warmest in the 20<sup>th</sup> century, with the mean surface temperature for 1999 being the fifth warmest on record since 1880.

In early 2000, a panel of atmospheric scientists for the National Research Council concluded in a report that global warming was, indeed, a reality. While the panel, headed by Chairman John Wallace, a professor of atmospheric sciences at the University of Washington, stated that it remained unclear whether human activities have contributed to the earth's increasing temperatures, it was apparent that global warming exists.

In 2001, following a request for further study by the incoming Bush administration in the [United](#)

---

[States](#), the National Academy of Sciences again confirmed that global warming had been in existence for the last 20 years. The study also projected an increase in temperature between 2.5 degrees and 10.4 degrees Fahrenheit by the year 2100. Furthermore, the study found the leading cause of global warming to be emissions of carbon dioxide from the burning of fossil fuels, and it noted that greenhouse gas accumulations in the earth's atmosphere was a result of human activities.

Within the scientific community, the controversy regarding has centered on the difference between surface air and upper air temperatures. Information collected since 1979 suggests that while the earth's surface temperature has increased by about a degree in the past century, the atmospheric temperature five miles above the earth's surface has indicated very little increase. Nevertheless, the panel stated that this discrepancy in temperature between surface and upper air does not invalidate the conclusion that global warming is taking place. Further, the panel noted that natural events, such as volcanic eruptions, can decrease the temperature in the upper atmosphere.

The major consequences of global warming potentially include the melting of the polar ice caps, which, in turn, contribute to the rise in sea levels. Many islands across the globe have already experienced a measurable loss of land as a result. Because global warming may increase the rate of evaporation, increased precipitation, in the form of stronger and more frequent storm systems, is another potential outcome. Other consequences of global warming may include the introduction and proliferation of new infectious diseases, loss of arable land (referred to as "desertification"), destructive changes to existing ecosystems, loss of biodiversity and the isolation of species, and concomitant adverse changes in the quality of human life.

### **International Policy Development in Regard to Global Warming:**

Regardless of what the precise nature of the relationship between greenhouse gas emissions and global warming may be, it seems that there is some degree of a connection between the phenomena. Any substantial reductions in greenhouse gas emissions and global warming trends will likely involve systematic changes in industrial operations, the use of advanced energy sources and technologies, as well as global cooperation in implementing and regulating these transformations.

In this regard, the United Nations Framework Convention on Climate Change (UNFCCC) stipulated the following objectives:

1. To stabilize "greenhouse gas" concentrations within the atmosphere, in such a manner that would preclude hazardous anthropogenic intervention into the existing biosphere and ecosystems of the world. This stabilization process would facilitate the natural adaptation of ecosystems to changes in climate.
2. To ensure and enable sustainable development and food production on a global scale.

\*\*\* See section on "International Environmental Agreements and Associations" for information related to international policies related to limiting greenhouse gases and controlling climate change emanating from historic summits at Kyoto, Copenhagen, Doha, and Paris. \*\*\*

## **2. Air Pollution**

Long before global warming reared its head as a significant issue, those concerned about the environment and public health noted the deleterious effects of human-initiated combustion upon the atmosphere. Killer smogs from coal burning triggered acute health emergencies in London and other places. At a lower level of intensity motor vehicle, power plant, and industrial emissions impaired long-range visibility and probably had some chronic adverse consequences on the respiratory systems of persons breathing such air.

In time, scientists began associating the sulfur dioxide and nitrogen oxides released from coal burning with significant acid deposition in the atmosphere, eventually falling as "acid rain." This phenomenon has severely degraded forestlands, especially in Europe and a few parts of the [United States](#). It has also impaired some aquatic ecosystems and eaten away the surface of some human artifacts, such as marble monuments. Scrubber technology and conversion to cleaner fuels have enabled the level of industrial production to remain at least constant while significantly reducing acid deposition. Technologies aimed at cleaning the air and curtailing acid rain, soot, and smog may, nonetheless, boomerang as the perils of global warming become increasingly serious. In brief, these particulates act as sort of a sun shade -- comparable to the effect of volcanic eruptions on the upper atmosphere whereby periods of active volcanism correlate with temporarily cooler weather conditions. Thus, while the carbon dioxide releases that are an inevitable byproduct of combustion continue, by scrubbing the atmosphere of pollutants, an industrial society opens itself to greater insolation (penetration of the sun's rays and consequent heating), and consequently, it is likely to experience a correspondingly greater rise in ambient temperatures.

The health benefits of removing the sources of acid rain and smog are indisputable, and no one would recommend a return to previous conditions. Nevertheless, the problematic climatic effects of continually increasing emissions of carbon dioxide and other greenhouse gases pose a major global environmental challenge, not as yet addressed adequately.

## **3. Ozone Depletion**

The stratospheric ozone layer functions to prevent ultraviolet radiation from reaching the earth. Normally, stratospheric ozone is systematically disintegrated and regenerated through natural

photochemical processes. The stratospheric ozone layer, however, has been depleted unnaturally as a result of anthropogenic (man-made) chemicals, most especially chlorine and bromide compounds such as chlorofluorocarbons (CFCs), halons, and various industrial chemicals in the form of solvents, refrigerants, foaming agents, aerosol propellants, fire retardants, and fumigants. Ozone depletion is of concern because it permits a greater degree of ultraviolet-B radiation to reach the earth, which then increases the incidences of cancerous malignancies, cataracts, and human immune deficiencies. In addition, even in small doses, ozone depletion affects the ecosystem by disturbing food chains, agriculture, fisheries and other forms of biological diversity.

Transnational policies enacted to respond to the dangers of ozone depletion include the 1985 Vienna Convention on the Protection of the Ozone Layer and the 1987 Montreal Protocol on Substances that Deplete the Ozone Layer. The Montreal Protocol was subsequently amended in London in 1990, Copenhagen in 1992 and Vienna in 1995. By 1996, 155 countries had ratified the Montreal Protocol, which sets out a time schedule for the reduction (and eventual elimination) of ozone depleting substances (OPS), and bans exports and imports of ODS from and to non-participant countries.

In general, the Protocol stipulates that developed countries must eliminate halon consumption by 1994 and CFC consumption by 1996, while developing countries must eliminate these substances by 2010. Consumption of methyl bromide, which is used as a fumigant, was to be frozen at the 1995 in developed countries, and fully eliminated in 2010, while developing countries are to freeze consumption by 2002, based on average 1995-1998 consumption levels. Methyl chloroform is to be phased out by 2005. Under the Montreal Protocol, most ODS will be completely eliminated from use by 2010.

#### **4. Land Degradation**

In recent decades, land degradation in more arid regions of the world has become a serious concern. The problem, manifest as both "desertification" and "devegetation," is caused primarily by climate variability and human activities, such as "deforestation," excessive cultivation, overgrazing, and other forms of land resource exploitation. It is also exacerbated by inadequate irrigation practices. Although the effects of droughts on drylands have been temporary in the past, today, the productivity and sustainability of these lands have been severely compromised for the long term. Indeed, in every region of the world, land degradation has become an acute issue.

##### **Desertification and Devegetation:**

"Desertification" is a process of land degradation causing the soil to deteriorate, thus losing its nutrients and fertility, and eventually resulting in the loss of vegetation, known as "devegetation."

As aforementioned, "desertification" and "devegetation" are caused by human activities, yet human beings are also the greatest casualties. Because these forms of land degradation affect the ability of the soil to produce crops, they concomitantly contribute to poverty. As population increases and demographic concentrations shift, the extent of land subject to stresses by those seeking to wrest subsistence from it has inexorably risen.

In response, the United Nations has formed the Convention to Combat Desertification-aimed at implementing programs to address the underlying causes of desertification, as well as measures to prevent and minimize its effects. Of particular significance is the formulation of policies on transboundary resources, such as areas around lakes and rivers. At a broader level, the Convention has established a Conference of Parties (COP), which includes all ratifying governments, for directing and advancing international action.

To ensure more efficacious use of funding, the Convention intends to reconfigure international aid to utilize a consultative and coordinated approach in the disbursement and expenditure of donor funds. In this way, local communities that are affected by desertification will be active participants in the solution-generation process. In-depth community education projects are envisioned as part of this new international aid program, and private donor financing is encouraged. Meanwhile, as new technologies are developed to deal with the problem of desertification, they need to be distributed for application across the world. Hence, the Convention calls for international cooperation in scientific research in this regard.

Desertification is a problem of sustainable development. It is directly connected to human challenges such as poverty, social and economic well-being and environmental protection as well. Broader environmental issues, such as climate change, biological diversity, and freshwater supplies, are indirectly related, so any effort to resolve this environmental challenge must entail coordinated research efforts and joint action.

### **Deforestation:**

Deforestation is not a recent phenomenon. For centuries, human beings have cut down trees to clear space for land cultivation, or in order to use the wood for fuel. Over the last 200 years, and most especially after World War II, deforestation increased because the logging industry became a globally profitable endeavor, and so the clearing of forested areas was accelerated for the purposes of industrial development. In the long term, this intensified level of deforestation is considered problematic because the forest is unable to regenerate itself quickly. The deforestation that has occurred in tropical rainforests is seen as an especially serious concern, due to the perceived adverse effects of this process upon the entire global ecosystem.

The most immediate consequence of deforestation is soil degradation. Soil, which is necessary for

the growth of vegetation, can be a fragile and vital property. Organically, an extensive evolution process must take place before soil can produce vegetation, yet at the same time, the effects of natural elements, such as wind and rain, can easily and quickly degrade this resource. This phenomenon is known as soil erosion. In addition, natural elements like wind and rain reduce the amount of fertile soil on the ground, making soil scarcity a genuine problem. When fertile topsoil that already exists is removed from the landscape in the process of deforestation, soil scarcity is further exacerbated. Equally significant is the fact that once land has been cleared so that the topsoil can be cultivated for crop production, not only are the nutrient reserves in the soil depleted, thus producing crops of inferior quality, but the soil structure itself becomes stressed and deteriorates further.

Another direct result of deforestation is flooding. When forests are cleared, removing the cover of vegetation, and rainfall occurs, the flow of water increases across the surface of land. When extensive water runoff takes place, the frequency and intensity of flooding increases. Other adverse effects of deforestation include the loss of wildlife and biodiversity within the ecosystem that supports such life forms.

At a broader level, tropical rainforests play a vital role in maintaining the global environmental system. Specifically, destruction of tropical rainforests affects the carbon dioxide cycle. When forests are destroyed by burning (or rotting), carbon dioxide is released into the air, thus contributing to an intensified "greenhouse effect." The increase in greenhouse gas emissions like carbon dioxide is a major contributor to global warming, according to many environmental scientists. Indeed, trees themselves absorb carbon dioxide in the process of photosynthesis, so their loss also reduces the absorption of greenhouse gases.

Tropical rainforest destruction also adversely affects the nitrogen cycle. Nitrogen is a key nutrient for both plants and animals. Plants derive nitrogen from soil, while animals obtain it via nitrogen-enriched vegetation. This element is essential for the formation of amino acids, and thereby for proteins and biochemicals that all living things need for metabolism and growth. In the nitrogen cycle, vegetation acquires these essential proteins and biochemicals, and then cyclically returns them to the atmosphere and global ecosystem. Accordingly, when tropical rainforest ecosystems are compromised, not only is vegetation removed; the atmosphere is also affected and climates are altered. At a more immediate level, the biodiversity within tropical rainforests, including wildlife and insect species and a wealth of plant varieties, is depleted. Loss of rare plants is of particular concern because certain species as yet unknown and unused could likely yield many practical benefits, for instance as medicines.

As a result of the many challenges associated with deforestation, many environmental groups and agencies have argued for government policies on the sustainable development of forests by governments across the globe. While many countries have instituted national policies and programs aimed at reducing deforestation, and substantial research has been advanced in regard to

sustainable and regenerative forestry development, there has been very little progress on an international level. Generally speaking, most tropical rainforests are located in developing and less developed countries, where economic growth is often dependent upon the exploitation of tropical rainforests. Timber resources as well as wildlife hunting tend to be particularly lucrative arenas.

In places such as the Amazon, where deforestation takes place for the construction of energy plants aimed at industrialization and economic development, there is an exacerbated effect on the environment. After forests are cleared in order to construct such projects, massive flooding usually ensues. The remaining trees then rot and decay in the wake of the flooding. As the trees deteriorate, their biochemical makeup becomes more acidic, producing poisonous substances such as hydrogen sulphide and methane gases. Acidified water subsequently corrodes the mechanical equipment and operations of the plants, which are already clogged by rotting wood after the floodwaters rise.

Deforestation generally arises from an economically plausible short-term motivation, but nonetheless poses a serious global concern because the effects go beyond national boundaries. The United Nations has established the World Commission on Forest and Sustainable Development. This body's task is to determine the optimal means of dealing with the issue of deforestation, without unduly affecting normal economic development, while emphasizing the global significance of protecting tropical forest ecosystems.

## **5. Water Resources**

For all terrestrial fauna, including humans, water is the most immediate necessity to sustain life. As the population has increased and altered an ever-greater portion of the landscape from its natural condition, demand on water resources has intensified, especially with the development of industrialization and large-scale irrigation. The supply of freshwater is inherently limited, and moreover distributed unevenly across the earth's landmasses. Moreover, not just demand for freshwater but activities certain to degrade it are becoming more pervasive. By contrast, the oceans form a sort of "last wilderness," still little explored and in large part not seriously affected by human activity. However, coastal environments - the biologically richest part of the marine ecosystem-are experiencing major depletion due to human encroachment and over-exploitation.

### **Freshwater:**

In various regions, for instance the Colorado River in the western [United States](#), current withdrawals of river water for irrigation, domestic, and industrial use consume the entire streamflow so that almost no water flows into the sea at the river's mouth. Yet development is ongoing in many such places, implying continually rising demand for water. In some areas reliant

on groundwater, aquifers are being depleted at a markedly faster rate than they are being replenished. An example is the San Joaquin Valley in California, where decades of high water withdrawals for agriculture have caused land subsidence of ten meters or more in some spots. Naturally, the uncertainty of future water supplies is particularly acute in arid and semi-arid regions. Speculation that the phenomenon of global warming will alter geographic and seasonal rainfall patterns adds further uncertainty.

Water conservation measures have great potential to alleviate supply shortages. Some city water systems are so old and beset with leaking pipes that they lose as much water as they meter. Broad-scale irrigation could be replaced by drip-type irrigation, actually enhancing the sustainability of agriculture. In many areas where heavy irrigation has been used for decades, the result is deposition of salts and other chemicals in the soil such that the land becomes unproductive for farming and must be abandoned.

Farming is a major source of water pollution. Whereas restrictions on industrial effluents and other "point sources" are relatively easy to implement, comparable measures to reform hydraulic practices at farms and other "nonpoint sources" pose a significantly knottier challenge. Farm-caused water pollution takes the following main forms:

- Nitrate pollution found in wells in intensive farming areas as a consequence of heavy fertilizer use is a threat to human health. The most serious danger is to infants, who by ingesting high-nitrate water can contract methemoglobinemia, sometimes called "blue baby syndrome," a potentially fatal condition.
- Fertilizer runoff into rivers and lakes imparts unwanted nutrients that cause algae growth and eventual loss of oxygen in the body of water, degrading its ability to support fish and other desirable aquatic life.
- Toxic agricultural chemicals - insecticides, herbicides, and fungicides - are detectable in some aquifers and waterways.

In general, it is much easier to get a pollutant into water than to retrieve it out. Gasoline additives, dry cleaning chemicals, other industrial toxins, and in a few areas radionuclides have all been found in water sources intended for human use. The complexity and long time scale of subterranean hydrological movements essentially assures that pollutants already deposited in aquifers will continue to turn up for decades to come. Sophisticated water treatment processes are available, albeit expensive, to reclaim degraded water and render it fit for human consumption. Yet source protection is unquestionably a more desirable alternative.

In much of the developing world, and even some low-income rural enclaves of the developed world, the population lacks ready access to safe water. Surface water and shallow groundwater

supplies are susceptible to contamination from untreated wastewater and failing septic tanks, as well as chemical hazards. The occurrence of waterborne disease is almost certainly greatly underreported.

### **Marine Resources:**

Coastal areas have always been desirable places for human habitation, and population pressure on them continues to increase. Many types of water degradation that affect lakes and rivers also affect coastal zones: industrial effluents, untreated or partially treated sewage, nutrient load from agriculture figure prominently in both cases. Prospects for more extreme storms as a result of global warming, as well as the pervasiveness of poorly planned development in many coastal areas, forebode that catastrophic hurricanes and landslides may increase in frequency in the future. Ongoing rise in sea levels will force remedial measures and in some cases abandonment of currently valuable coastal property.

Fisheries over much of the globe have been overharvested, and immediate conservation measures are required to preserve stocks of many species. Many governments subsidized factory-scale fishing fleets in the 1970s and 1980s, and the resultant catch increase evidently surpassed a sustainable level. It is uncertain how much of the current decline in fish stocks stems from overharvesting and how much from environmental pollution. The deep ocean remains relatively unaffected by human activity, but continental shelves near coastlines are frequently seriously polluted, and these close-to-shore areas are the major biological nurseries for food fish and the smaller organisms they feed on.

## **6. Environmental Toxins**

Toxic chemical pollution exploded on the public consciousness with disclosure of spectacularly polluted industrial areas such as Love Canal near Buffalo, New York. There is no question that pollutants such as organophosphates or radionuclides can be highly deleterious to health, but evidence to date suggests that seriously affected areas are a localized rather than universal problem.

While some explore the possibilities for a lifestyle that fully eschews use of modern industrial chemicals, the most prevalent remedial approach is to focus on more judicious use. The most efficient chemical plants are now able to contain nearly all toxic byproducts of their production processes within the premises, minimizing the release of such substances into the environment. Techniques such as Integrated Pest Management (IPM) dictate limited rather than broadcast use of pesticides: application only when needed using the safest available chemical, supplemented as much as possible with nontoxic controls.

While heightened public awareness and growing technical sophistication suggest a hopeful outlook on limiting the damage from manmade environmental toxins, one must grant that previous incidents of their misuse and mishandling have already caused environmental damage that will have to be dealt with for many years to come. In the case of the most hazardous radioactive substances, the time scale for successful remediation actually extends beyond that of the recorded history of civilization. Moreover, in this era of high population density and rapid economic growth, quotidian activities such as the transport of chemicals will occasionally, seemingly inevitably result in accidents with adverse environmental consequences.

## **7. "Islandization" and Biodiversity**

With increased awareness regarding the adverse effects of unregulated hunting and habitat depletion upon wildlife species and other aspects of biodiversity, large-scale efforts across the globe have been initiated to reduce and even reverse this trend.

In every region of the world, many species of wildlife and areas of biodiversity have been saved from extinction. Nationally, many countries have adopted policies aimed at preservation and conservation of species, and one of the most tangible measures has been the proliferation of protected habitats. Such habitats exist in the form of wildlife reserves, marine life reserves, and other such areas where biodiversity can be protected from external encroachment and exploitation.

Despite these advances in wildlife and biodiversity protection, further and perhaps more intractable challenges linger. Designated reserves, while intended to prevent further species decline, exist as closed territories, fragmented from other such enclaves and disconnected from the larger ecosystem. This environmental scenario is referred to as "islandization." Habitat reserves often serve as oversized zoos or game farms, with landscapes and wildlife that have effectively been "tamed" to suit. Meanwhile, the larger surrounding ecosystem continues to be seriously degraded and transformed, while within the islandized habitat, species that are the focus of conservation efforts may not have sufficient range and may not be able to maintain healthy genetic variability.

As a consequence, many conservationists and preservationists have demanded that substantially larger portions of land be withheld as habitat reserves, and a network of biological corridors to connect continental reserves be established. While such efforts to combat islandization have considerable support in the [United States](#), how precisely such a program would be instituted, especially across national boundaries, remains a matter of debate. International conservationists and preservationists say without a network of reserves a massive loss of biodiversity will result.

The concept of islandization illustrates why conservation and preservation of wildlife and biodiversity must consider and adopt new, broader strategies. In the past, conservation and preservation efforts have been aimed at specific species, such as the spotted owl and grizzly bear in

North America, the Bengal tiger in Southeast Asia, the panda in [China](#), elephants in Africa. Instead, the new approach is to simultaneously protect many and varied species that inhabit the same ecosystem. This method, referred to as "bio-regional conservation," may more efficaciously generate longer-term and more far-reaching results precisely because it is aimed at preserving entire ecosystems, and all the living things within.

### **More About Biodiversity Issues:**

This section is directly taken from the United Nations Environmental Program: "[Biodiversity Assessment](#)"

The Global Biodiversity Assessment, completed by 1500 scientists under the auspices of United Nations Environmental Program in 1995, updated what is known (or unknown) about global biological diversity at the ecosystem, species and genetic levels. The assessment was uncertain of the total number of species on Earth within an order of magnitude. Of its working figure of 13 million species, only 13 percent are scientifically described. Ecological community diversity is also poorly known, as is its relationship to biological diversity, and genetic diversity has been studied for only a small number of species. The effects of human activities on biodiversity have increased so greatly that the rate of species extinctions is rising to hundreds or thousands of times the background level. These losses are driven by increasing demands on species and their habitats, and by the failure of current market systems to value biodiversity adequately. The Assessment calls for urgent action to reverse these trends.

There has been a new recognition of the importance of protecting marine and aquatic biodiversity. The first quantitative estimates of species losses due to growing coral reef destruction predict that almost 200,000 species, or one in five presently contributing to coral reef biodiversity, could die out in the next 40 years if human pressures on reefs continue to increase.

Since Rio, many countries have improved their understanding of the status and importance of their biodiversity, particularly through biodiversity country studies such as those prepared under the auspices of UNEP/GEF. The [United Kingdom](#) identified 1250 species needing monitoring, of which 400 require action plans to ensure their survival. Protective measures for biodiversity, such as legislation to protect species, can prove effective. In the USA, almost 40 percent of the plants and animals protected under the Endangered Species Act are now stable or improving as a direct result of recovery efforts. Some African countries have joined efforts to protect threatened species through the 1994 Lusaka Agreement, and more highly migratory species are being protected by specialized cooperative agreements among range states under the Bonn Agreement.

There is an emerging realization that a major part of conservation of biological diversity must take place outside of protected areas and involve local communities. The extensive agricultural areas

occupied by small farmers contain much biodiversity that is important for sustainable food production. Indigenous agricultural practices have been and continue to be important elements in the maintenance of biodiversity, but these are being displaced and lost. There is a new focus on the interrelationship between agrodiversity conservation and sustainable use and development practices in smallholder agriculture, with emphasis on use of farmers' knowledge and skills as a source of information for sustainable farming.

Perhaps even more important than the loss of biodiversity is the transformation of global biogeochemical cycles, the reduction in the total world biomass, and the decrease in the biological productivity of the planet. While quantitative measurements are not available, the eventual economic and social consequences may be so significant that the issue requires further attention.

## **International Environmental Agreements and Associations**

### **International Policy Development in Regard to Global Warming:**

#### **Introduction**

Regardless of what the precise nature of the relationship between greenhouse gas emissions and global warming may be, it seems that there is some degree of a connection between the phenomena. Any substantial reductions in greenhouse gas emissions and global warming trends will likely involve systematic changes in industrial operations, the use of advanced energy sources and technologies, as well as global cooperation in implementing and regulating these transformations.

In this regard, the United Nations Framework Convention on Climate Change (UNFCCC) stipulated the following objectives:

1. To stabilize "greenhouse gas" concentrations within the atmosphere, in such a manner that would preclude hazardous anthropogenic intervention into the existing biosphere and ecosystems of the world. This stabilization process would facilitate the natural adaptation of ecosystems to changes in climate.
2. To ensure and enable sustainable development and food production on a global scale.

Following are two discussions regarding international policies on the environment, followed by listings of international accords.

### ***Special Entry: The Kyoto Protocol***

The UNFCCC was adopted at the Rio Earth Summit in 1992, and entered into force in 1994. Over 175 parties were official participants.

Meanwhile, however, many of the larger, more industrialized nations failed to reach the emissions' reduction targets, and many UNFCCC members agreed that the voluntary approach to reducing emissions had not been successful. As such, UNFCCC members reached a consensus that legally binding limits were necessitated, and agreed to discuss such a legal paradigm at a meeting in Kyoto, [Japan](#) in 1997. At that meeting, the UNFCCC forged the Kyoto Protocol. This concord is the first legally binding international agreement that places limits on emissions from industrialized countries. The major greenhouse gas emissions addressed in the Kyoto Protocol include carbon dioxide, nitrous oxide, hydrofluorocarbons, perfluorocarbons, sulfur hexafluoride, and methane.

The provisions of the Kyoto Protocol stipulate that economically advanced nations must reduce their combined emissions of greenhouse gases, by approximately five percent from their 1990 levels, before the 2008-2010 deadline. Countries with the highest carbon dioxide emissions, such as the [United States](#) (U.S.), many of the European Union (EU) countries, and [Japan](#), are to reduce emissions by a scale of 6 to 8 percent. All economically advanced nations must show "demonstrable progress" by 2005. In contrast, no binding limits or timetable have been set on

developing countries. Presumably, this distinction is due to the fact that most developing countries - with the obvious exceptions of [India](#) and [China](#) -- simply do not emit as many greenhouse gases as do more industrially advanced countries. Meanwhile, these countries are entrenched in the process of economic development.

Regardless of the aforementioned reasoning, there has been strong opposition against the asymmetrical treatment assigned to emissions limits among developed and developing countries. Although this distinction might be regarded as unfair in principle, associations such as the Alliance of Small Island States have been vocal in expressing how global warming -- a result of greenhouse gas emissions - has contributed to the rise in sea level, and thus deleteriously affected their very existence as island nation states. For this reason, some parties have suggested that economically advanced nations, upon returning to their 1990 levels, should be required to further reduce their greenhouse gas emissions by a deadline of 2005. In response, interested parties have observed that even if such reductions were undertaken by economically advanced nations, they would not be enough to completely control global warming. Indeed, a reduction in the rate of fossil fuel usage by developing nations would also be necessary to have substantial ameliorative effect on global warming. Indeed, a reduction in the rate of fossil fuel usage by developing nations would also be necessary to have substantial ameliorative effect on global warming.

As such, the Protocol established a "Clean Development Mechanism" which permits developed countries to invest in projects aimed at reducing emissions within developing countries in return for credit for the reductions. Ostensibly, the objective of this mechanism is to curtail emissions in developing countries without unduly penalizing them for their economic development. Under this model, the countries with more potential emissions credits could sell them to other signatories of the Kyoto Protocol, whose emissions are forecast to significantly rise in the next few years. Should this trading of emissions credits take place, it is estimated that the Kyoto Protocol's emissions targets could still be met.

In 1999, the International Energy Outlook projected that Eastern Europe, the former Soviet Union and Newly Independent States, as well as parts of Asia, are all expected to show a marked decrease in their level of energy-related carbon emissions in 2010. Nations with the highest emissions, specifically, the U.S., the EU and [Japan](#), are anticipated to reduce their emissions by up to 8 percent by 2012. By 2000, however, the emissions targets were not on schedule for achievement. Indeed, the U.S. Department of Energy estimates forecast that by 2010, there will be a 34 percent increase in carbon emissions from the 1990 levels, in the absence of major shifts in policy, economic growth, energy prices, and consumer trends. Despite this assessment in the U.S., international support for the Kyoto Protocol remained strong, especially among European countries and island states, who view the pact as one step in the direction away from reliance on fossil fuels and other sources of greenhouse gases.

In 2001, U.S. President, George W. Bush, rejected his country's participation in the Kyoto

---

Protocol, saying that the costs imposed on the global economic system, and especially, on the US, overshadowed the benefits of the Protocol. He also cited the unfair burden on developed nations to reduce emissions, as another primary reasons for withdrawal from the international pact, as well as insufficient evidence regarding the science of global warming. Faced with impassioned international disapproval for his position, the U.S. president stated that his administration remained interested in dealing with the matter of global warming, but would endorse alternative measures to combat the problem, such as voluntary initiatives limiting emissions. Critics of Bush's position, however, have noted that it was the failure of voluntary initiatives to reduce emissions following the Rio Summit that led to the establishment of the Kyoto Protocol in the first place.

In the wake of the Bush administration's decision, many participant countries resigned themselves to the reality that the goals of the Kyoto Protocol might not be achieved without U.S. involvement. Nevertheless, in Bonn, [Germany](#), in July 2001, the remaining participant countries struck a political compromise on some of the key issues and sticking points, and planned to move forward with the Protocol, irrespective of the absence of the U.S. The key compromise points included the provision for countries to offset their targets with carbon sinks (these are areas of forest and farmland which can absorb carbon through the process of photosynthesis). Another compromise point within the broader Bonn Agreement was the reduction of emissions cuts of six gases from over 5 percent to a more achievable 2 percent. A third key change was the provision of funding for less wealthy countries to adopt more progressive technologies.

In late October and early November 2001, the UNFCCC's 7<sup>th</sup> Conference of the Parties met in Marrakesh, [Morocco](#), to finalize the measures needed to make the Kyoto Protocol operational. Although the UNFCCC projected that ratification of the Protocol would make it legally binding within a year, many critics noted that the process had fallen short of implementing significant changes in policy that would be necessary to actually stop or even slow climate change. They also maintained that the absence of U.S. participation effectively rendered the Protocol into being a political exercise without any substance, either in terms of transnational policy or in terms of environmental concerns.

The adoption of the compromises ensconced within the Bonn Agreement had been intended to make the provisions of the Kyoto Protocol more palatable to the U.S. In this regard, it failed to achieve its objective as the Bush administration continued to eschew participation in the international accord. Still, however, the Bonn Agreement did manage to render a number of other positive outcomes. Specifically, in 2002, key countries, such as [Russia](#), [Japan](#) and [Canada](#) agreed to ratify the protocol, bringing the number of signatories to 178. The decision by key countries to ratify the protocol was regarded as "the kiss of life" by observers.

By 2005, on the eve of a climate change conference in London, British Prime Minister Tony Blair was hoping to deal with the problems of climate change beyond the provisions set forth in the

Kyoto Protocol. Acknowledging that the Kyoto Protocol could not work in its current form, Blair wanted to open the discussion for a new climate change plan.

Blair said that although most of the world had signed on to Kyoto, the protocol could not meet any of its practical goals of cutting greenhouse gas emissions without the participation of the United States, the world's largest polluter. He also noted that any new agreement would have to include India and China -- significant producers of greenhouse gas emissions, but exempt from Kyoto because they have been classified as developing countries. Still, he said that progress on dealing with climate change had been stymied by "a reluctance to face up to reality and the practical action needed to tackle problem."

Blair also touted the "huge opportunities" in technology and pointed toward the possibilities offered by wind, solar and nuclear power, along with fuel cell technology, eco-friendly biofuels, and carbon capture and storage which could generate low carbon power. Blair also asserted that his government was committed to achieving its domestic goal of reducing carbon dioxide emissions by 20 percent by 2010.

In the United States, President George W. Bush has said that global warming remained a debatable issue and despite conclusions reached by his own Environmental Protection Agency, he has not agreed with the conclusion that global warming and climate change are linked with human activities. Bush has also refused to ratify Kyoto on the basis of its economic costs.

Australia, an ally of the United States, has taken a similarly dim view of the Kyoto Protocol. Ahead of the November 2005 climate change meeting in Canada in which new goals for the protocol were to be discussed, Australia's Environment Minister, Ian Campbell, said that negotiating new greenhouse gas emission levels for the Kyoto Protocol would be a waste of time. Campbell said, "There is a consensus that the caps, targets and timetables approach is flawed. If we spend the next five years arguing about that, we'll be fiddling and negotiating while Rome burns." Campbell, like the Bush administration, has also advocated a system of voluntary action in which industry takes up new technologies rather than as a result of compelling the reduction of emissions. But the Australian Conservation Foundation (ACF) has called on its government to ratify the Kyoto Protocol, to establish a system of emissions trading, and to set binding limits on emissions. Interestingly, although it did not sign on to Kyoto, Australia was expected to meet its emissions target by 2012 (an 8 percent increase in 1990 levels in keeping with the country's reliance on coal). But this success has nothing to do with new technologies and is due to state-based regulations on land clearing.

Note: The Kyoto Protocol calls for developed nations to cut greenhouse emissions by 5.2 percent of 1990 levels by 2012.

***Special Entry: Climate Change Summit in Copenhagen (2009) --***

In December 2009, the United Nations Climate Change Summit opened in the Danish capital of Copenhagen. The summit was scheduled to last from Dec. 7-18, 2009. Delegates from more than 190 countries were in attendance, and approximately 100 world leaders, including British Prime Minister Gordon Brown and [United States](#) President Barack Obama, were expected to participate. At issue was the matter of new reductions targets on greenhouse gas emissions by 2020.

Despite earlier fears that little concurrence would come from the conference, effectively pushing significant actions forward to a 2010 conference in [Mexico](#) City, negotiators were now reporting that the talks were productive and several key countries, such as [South Africa](#), had pledged to reduce greenhouse gas emissions. The two main issues that could still lead to cleavages were questions of agreement between the industrialized countries and the developing countries of the world, as well as the overall effectiveness of proposals in seriously addressing the perils of climate change.

On Dec. 9, 2009, four countries -- the [United Kingdom](#), [Australia](#), [Mexico](#) and [Norway](#) -- presented a document outlining ideas for raising and managing billions of dollars, which would be intended to help vulnerable countries dealing with the perils of climate change. Described as a "green fund," the concept could potentially help small island states at risk because of the rise in sea level. [Bangladesh](#) identified itself as a potential recipient of an assistance fund, noting that as a country plagued by devastating floods, it was particularly hard-hit by climate change. The "green fund" would fall under the rubric of the United Nations Framework Convention on Climate Change, for which developed countries have been committed to quantifying their emission reduction targets, and also to providing financial and technical support to developing countries.

The [United Kingdom](#), [Australia](#), [Mexico](#) and [Norway](#) also called for the creation of a new legal treaty that would replace the Kyoto Protocol. This new treaty, which could go into force in 2012, would focus largely on the reduction of greenhouse gas emissions by 2020. But [Australia](#) went even further in saying that the successor treaty to the Kyoto Protocol, should be one with provisions covering all countries. Such a move would be a departure from the structure of the Kyoto Protocol, which contained emissions targets for industrialized countries due to the prevailing view that developed countries had a particular historic responsibility to be accountable for climate change. More recently, it has become apparent that substantial reductions in greenhouse gas emissions demanded by scientists would only come to pass with the participation also of significant developing nation states, such as [China](#) and [India](#). Indeed, one of the most pressing critiques of the Kyoto Protocol was that it was a "paper tiger" that failed to address the impact of the actions of emerging economies like [China](#) and [India](#), with its focus on the developed economies.

Now, in 2009, [China](#) -- as the world's biggest greenhouse gas emitter -- was responding this dubious distinction by vocalizing its criticism of the current scenario and foregrounding its new commitments. Ahead of the Copenhagen summit, [China](#) had announced it would reduce the

intensity of its carbon emissions per unit of its GDP in 2020 by 40 to 45 percent against 2005 levels. With that new commitment at hand, [China](#) was now accusing the [United States](#) and the European Union of shirking their own responsibilities by setting weak targets for greenhouse gas emissions cuts. Senior Chinese negotiator, Su Wei, characterized the goals of the world's second largest greenhouse gas emitter -- the [United States](#) -- as "not notable," and the European Union's target as "not enough." Su Wei also took issue with [Japan](#) for setting implausible preconditions.

On Dec. 11, 2009, [China](#) demanded that developed and wealthy countries in Copenhagen should help deliver a real agreement on climate change by delivering on their promises to reduce carbon emissions and provide financial support for developing countries to adapt to global warming. In so doing, China's Vice Foreign Minister He Yafei said his country was hoping that a "balanced outcome" would emerge from the discussions at the summit. Echoing the position of the Australian government, He Yafei spoke of a draft agreement as follows: "The final document we're going to adopt needs to be taking into account the needs and aspirations of all countries, particularly the most vulnerable ones."

China's Vice Foreign Minister emphasized the fact that climate change was "a matter of survival" for developing countries, and accordingly, such countries need wealthier and more developed countries to accentuate not only their pledges of emissions reduction targets, but also their financial commitments under the aforementioned United Nations Framework Convention on Climate Change. To that end, scientists and leaders of small island states in the Indian Ocean, the Pacific Ocean and the Caribbean Sea, have highlighted the existential threat posed by global warming and the concomitant rise in sea level.

China aside, attention was also on [India](#) -- another major player in the developing world and a country with an industrializing economy that was impacting the environment. At issue was the Indian government's decision to set a carbon intensity target, which would slow emissions growth by up to 25 percent by the 2020 deadline. This strong position was resisted by some elements in [India](#), who argued that their country should not be taking such a strong position when developed wealthy countries were yet to show accountability for their previous commitments to reduce greenhouse gas emissions. The matter grew so heated that the members of the opposition stormed out of the parliament in protest as Indian Environment Minister Jairam Ramesh defended the policy. But the political pressure at home in [India](#) was leaving the Indian delegation in Copenhagen in a state of chaos as well. In fact, India's top environmental negotiator refused to travel to Copenhagen in protest of the government's newly-announced stance.

China and [India](#) were joined by [Brazil](#) and [South Africa](#) in the crafting of a draft document calling for a new global climate treaty to be completed by June 2010. Of concern has been the realization that there was insufficient time to find concurrence on a full legal treaty, which would leave countries only with a politically-binding text by the time the summit at Copenhagen closed. But Guyana's leader, President Bharrat Jagdeo, warned that the summit in [Denmark](#) would be

classified as a failure unless a binding document was agreed upon instead of just political consensus. He urged his cohorts to act with purpose saying, "Never before have science, economics, geo-strategic self-interest and politics intersected in such a way on an issue that impacts everyone on the planet."

Likewise, [Tuvalu](#) demanded that legally binding agreements emerge from Copenhagen. Its proposal was supported by many of the vulnerable countries, from small island states and sub-Saharan Africa, all of whom warned of the catastrophic impact of climate change on their citizens. [Tuvalu](#) also called for more aggressive action, such as an amendment to the 1992 agreement, which would focus on sharp greenhouse gas emissions and the accepted rise in temperatures, due to the impact the rise in seas. The delegation from [Kiribati](#) joined the call by drawing attention to the fact that one village had to be abandoned due to waist-high water, and more such effects were likely to follow. Kiribati's Foreign Secretary, Tessie Lambourne, warned that the people of [Kiribati](#) could well be faced with no homeland in the future saying, "Nobody in this room would want to leave their homeland." But despite such impassioned pleas and irrespective of warnings from the Intergovernmental Panel on Climate Change that the rise in sea level from melting polar ice caps would deleteriously affect low-lying atolls such as such as [Tuvalu](#) and [Kiribati](#) in the Pacific, and the [Maldives](#) in the Indian Ocean, the oil-giant [Saudi Arabia](#) was able to block this move.

Meanwhile, within the developed countries, yet another power struggle was brewing. The European Union warned it would only agree to raise its target of 20 percent greenhouse gas emissions reductions to 30 percent if the [United States](#) demonstrated that it would do more to reduce its own emissions. It was unknown if such pressure would yield results. [United States](#) President Barack Obama offered a "provisional" 2020 target of 17 percent reductions, noting that he could not offer greater concessions at Copenhagen due to resistance within the [United States](#) Congress, which was already trying to pass a highly controversial "cap and trade" emissions legislation. However, should that emissions trading bill fail in the Senate, the [United States](#) Environment Protection Agency's declaration that greenhouse gases pose a danger to human health and the environment was expected to facilitate further regulations and limits on power plants and factories at the national level. These moves could potentially strengthen the Obama administration's offering at Copenhagen. As well, President Obama also signaled that he would be willing to consider the inclusion of international forestry credits.

Such moves indicated willingness by the Obama administration to play a more constructive role on the international environmental scene than its predecessor, the Bush administration. Indeed, ahead of his arrival at the Copenhagen summit, President Barack Obama's top environmental advisors promised to work on a substantial climate change agreement. To that end, [United States](#) Environmental Protection Agency Administrator Lisa Jackson said at a press conference, "We are seeking robust engagement with all of our partners around the world." But would this pro-engagement assertion yield actual results?

By Dec. 12, 2009, details related to a draft document prepared by Michael Zammit Cutajar, the head of the Ad-hoc Working Group on Long-Term Cooperative Action, were released at the Copenhagen climate conference. Included in the document were calls for countries to make major reductions in carbon emissions over the course of the next decade. According to the Washington Post, industrialized countries were called on to make cuts of between 25 percent and 40 percent below 1990 levels -- reductions that were far more draconian than the [United States](#) was likely to accept. As discussed above, President Obama had offered a provisional reduction target of 17 percent. The wide gap between the released draft and the United States' actual stated position suggested there was much more negotiating in the offing if a binding agreement could be forged, despite the Obama administration's claims that it was seeking greater engagement on this issue.

In other developments, the aforementioned call for financial support of developing countries to deal with the perils of climate change was partly answered by the European Union on Dec. 11, 2009. The European bloc pledged an amount of 2.4 billion euros (US\$3.5 billion) annually from 2010 to 2012. Environment Minister Andreas Carlgren of [Sweden](#) -- the country that holds the rotating presidency of the European Union at the time of the summit -- put his weight behind the notion of a "legally binding deal." Meanwhile, Yvo de Boer, a top United Nations climate change official, focused less on the essence of the agreement and more on tangible action and effects saying, "Copenhagen will only be a success if it delivers significant and immediate action that begins the day the conference ends."

The division between developed and developing countries in Copenhagen reached new heights on Dec. 14, 2009, when some of the poor and less developed countries launched a boycott at the summit. The move, which was spurred by African countries but backed by [China](#) and [India](#), appeared to be geared toward redirecting attention and primary responsibility to the wealthier and more industrialized countries. The impasse was resolved after the wealthier and more industrialized countries offered assurances that they did not intend on shirking from their commitments to reducing greenhouse gases. As a result, the participating countries ceased the boycott.

Outside the actual summit, thousands of protestors had gathered to demand crucial global warming, leading to clashes between police and demonstrators elsewhere in the Danish capital city. There were reports of scattered violence across Copenhagen and more than 1,000 people were arrested.

Nevertheless, by the second week of the climate change summit, hopes of forging a strong deal were eroding as developed and developing nations remained deadlocked on sharing cuts in greenhouse gases, and particularly on the matters of financing and temperature goals. In a bid to shore up support for a new climate change, [United States](#) President Barack Obama joined other world leaders in Copenhagen. On Dec. 14, 2009, there was a standoff brewing between the [United States](#) and [China](#). At issue was China's refusal to accept international monitoring of its

expressed targets for reducing greenhouse gas emissions. The [United States](#) argued that China's opposition to verification could be a deal-breaker.

By the close of the summit, the difficult process eventually resulted in some consensus being cultivated. A draft text called for \$100 billion a year by 2020 to assist poor nations cope with climate change, while aiming to limit global warming to two degrees Celsius compared with pre-industrial levels. The deal also included specific targets for developed countries to reduce greenhouse gas emissions, and called for reductions by developing countries as a share of their economies. Also included in the agreement was a mechanism to verify compliance. The details of the agreement were supported by President Barack Obama, Chinese Premier Wen Jiabao, Indian Prime Minister Manmohan Singh and Brazilian President Luiz Inacio Lula da Silva.

This draft would stand as an interim agreement, with a legally-binding international pact unlikely to materialize until 2010. In this way, the summit in Copenhagen failed to achieve its central objective, which was to negotiate a successor to the Kyoto Protocol on greenhouse gas emissions.

#### Editor's Note

In the background of these developments was the growing global consciousness related to global warming and climate change. Indeed, as the Copenhagen summit was ongoing, it was clear there was enormous concurrence on the significance of the stakes with an editorial on the matter of climate change being published in 56 newspapers in 45 countries. That editorial warned that without global action, climate change would "ravage our planet." Meanwhile, a global survey taken by Globescan showed that concern over global warming had exponentially increased from 1998 -- when only 20 percent of respondents believed it to be a serious problem -- to 64 percent in 2009. Such survey data, however, was generated ahead of the accusations by climate change skeptics that some climate scientists may have overstated the case for global warming, based on emails derived in an illicit manner from a British University.

#### ***Special Entry: Climate change talks in Doha in [Qatar](#) extend life of Kyoto Protocol (2012)***

December 2012 saw climate talks ensue in the Qatari city of Doha as representatives from countries across the world gathered to discuss the fate of the Kyoto Protocol, which seeks to minimize greenhouse gas emissions. The summit yielded results with decisions made (1) to extend the Kyoto Protocol until 2020, and (2) for wealthier countries to compensate poorer countries for the losses and damage incurred as a result of climate change.

In regards to the second matter, Malia Talakai of [Nauru](#), a leading negotiator for the Alliance of Small Island States, explained the necessity of the compensation package as follows: "We are trying to say that if you pollute you must help us."

This measure was being dubbed the "Loss and Damage" mechanism, and was being linked with [United States](#) President Barack Obama's request for \$60 billion from Congress to deal with the devastation caused by Hurricane Sandy months before. The sight of a hurricane bearing down on the northern Atlantic seaboard, along with the reality of the scope of reconstruction, appeared to have illustrated the economic costs of climate change -- not so much as a distant environmental issue -- but as a danger to the quotidian lives of people. Still, there was blame to be placed on the [United States](#) and European countries -- some of world's largest emitters -- for failing to do more to reduce emissions.

To that latter end, there was in fact little progress made on the central issue of reducing greenhouse gas emissions. Had those emissions been reduced, there would have been less of a need to financially deal with the devastation caused by climate change. One interpretation was that the global community was accepting the fact that industrialization was contributing to global warming, which had deleterious effects on the polar ice caps and concomitantly on the rise of sea level, with devastating effects for small island nations. Thus, wealthier countries were willing to pay around \$10 billion a year through 2020, effectively in "damages," to the poor countries that could be viewed as the "collateral damage" of industrial progress. But damages today could potentially be destruction tomorrow, leaving in place the existential challenges and burdens to be born by some of the world's smallest and least wealthy island countries.

Perhaps not surprisingly, the representative for the small island nation states at the Doha summit responded with ire, characterizing the lack of progress on reducing emissions as follows: "We see the package before us as deeply deficient in mitigation (carbon cuts) and finance. It's likely to lock us on the trajectory to a 3,4,5C rise in global temperatures, even though we agreed to keep the global average temperature rise of 1.5C to ensure survival of all islands. There is no new finance (for adapting to climate change and getting clean energy) -- only promises that something might materialize in the future. Those who are obstructive need to talk not about how their people will live, but whether our people will live."

Indeed, in most small island countries not just in the Pacific, but also the Caribbean and Indian Ocean, ecological concerns and the climate crisis have been dominant themes with dire life and death consequences looming in the background for their people. Small island nations in these region are already at risk from the rise of sea-level, tropical cyclones, floods. But their very livelihoods of fishing and subsistence farming were also at risk as a result of ecological and environmental changes. Increasingly high storm surges can wipe out entire villages and contaminate water supplies. Accordingly, the very existence of island nations, such as [Kiribati](#) and [Tuvalu](#), are at severe risk of being obliterated from the map. Yet even with the existential threat of being wiped off the map in the offing, the international community has been either slow or restrictive in its efforts to deal with global warming, climate change, economic and ecological damage, as well as the emerging global challenge of environmental refugees.

A 2012 report from the United Nations Environment Program (UNEP) and the Pacific Regional Environment Program underlined the concerns of small island nations and their people as it concluded that the livelihoods of approximately 10 million people in Pacific island communities were increasingly vulnerable to climate change. In fact, low-lying islands in that region would likely confront losses of up to 18 percent of gross domestic product due to climate change, according to the report. The report covers 21 countries and territories, including [Fiji](#), [Kiribati](#), [Samoa](#) and [Tonga](#), and recommended environmental legislation intended to deal with the climate crisis facing the small island countries particularly. As noted by David Sheppard, the director general of the Pacific Regional Environment Program that co-sponsored this study: "The findings... emphasize the need more than ever to raise the bar through collective actions that address the region's environmental needs at all levels."

Regardless of the failures of the summit in [Qatar](#) (discussed above), the meeting did facilitate a process starting in 2015, which would bind both wealthy and poor countries together in the mission of forging a new binding treaty that would replace the Kyoto Protocol and tackle the central causes of climate change.

For more information on the threats faced in small island nations by climate change and the measures being undertaken to lobby for international action, please see the Alliance for Small Island States available online at the URL: <http://aosis.org/>

### ***Special Report***

#### ***COP 21 summit in Paris ends with historic agreement to tackle climate change; rare international consensus formed on environmental crisis facing the planet (2015) --***

In mid-December 2015, the highly-anticipated United Nations climate conference of parties (COP) in Paris, [France](#), ended with a historic agreement. In fact, it would very likely be understood as the most significant international agreement signed by all the recognized countries of the world since the Cold War. Accordingly, the Paris Agreement was being distinguished as the first multilateral pact that would compel all countries across the world to cut its carbon emissions -- one of the major causes of increasing greenhouse gas emissions, which contribute to global warming, and its deleterious effects ranging from the dangerous rise in sea level to catastrophic climate change.

The accord, which was dubbed to be the "Paris Agreement," was the work of rigorous diplomacy and fervent environmental advocacy, and it aimed to address the climate change crisis facing the planet. As many as 195 countries were represented in the negotiations that led to the landmark climate deal. Indeed, it was only after weeks of passionate debate that international concurrence

was reached in addressing the environmental challenges confronting the world, with particular attention to moving beyond fossil fuels and reducing greenhouse gas emissions.

The success of the COP 21 summit in Paris and the emergence of the landmark Paris Agreement was, to some extent, attributed to the efforts of France's Foreign Minister Laurent Fabius who presided over the negotiations. The French foreign minister's experience and credentials as a seasoned diplomat and respected statesman paid dividends. He skillfully guided the delegates from almost 200 countries and interest groups along the negotiations process, with ostensibly productive results and a reasonably robust deal to show for it.

On Dec. 12, 2015, French Foreign Minister Fabius officially adopted the agreement, declaring: "I now invite the COP to adopt the decision entitled Paris Agreement outlined in the document. Looking out to the room I see that the reaction is positive, I see no objections. The Paris agreement is adopted." Once Foreign Minister Fabius' gavel was struck, symbolically inaugurating the Paris Agreement into force, the COP delegate rushed to their feet with loud and bouyant cheers as well as thunderous applause.

In general, the Paris Agreement was being hailed as a victory for enviromental activists and a triumph for international diplomats, while at the same time being understood as simply an initial -- and imperfect -- move in the direction of a sustainable future. China's chief negotiator, Xie Zhenhua, issued this message, saying that while the accord was not ideal, it should "not prevent us from marching historical steps forward."

United States President Barack Obama lauded the deal as both "ambitious" and "historic," and the work of strenuous multilateral negotiations as he declared, "Together, we've shown what's possible when the world stands as one." The [United States](#) leader acknowledged that the accord was not "perfect," but he reminded the critics that it was "the best chance to save the one planet we have."

Former [United States](#) Vice President Al Gore, one of the world's most well known environmental advocates, issued a lengthy statement on the accomplishments ensconced in the Paris Agreement. He highlighted the fact that the Paris Agreement was a first step towards a future with a reduced carbon footprint on Planet Earth as he said, "The components of this agreement -- including a strong review mechanism to enhance existing commitments and a long-term goal to eliminate global-warming pollution this century -- are essential to unlocking the necessary investments in our future. No agreement is perfect, and this one must be strengthened over time, but groups across every sector of society will now begin to reduce dangerous carbon pollution through the framework of this agreement."

The central provisions of the Paris Agreement included the following items:

- Greenhouse gas emissions should peak as quickly as possible, with a move towards balancing

energy sources, and ultimately the decrease of greenhouse gases in the second half of this century

- Global temperature increase would be limited to 1.5 degrees Centigrade above pre-industrial levels and would be held "well below" the two degrees Centigrade threshold
- Progress on these goals would be reviewed every five years beginning in 2020 with new greenhouse gas reduction targets issued every five years
- \$100 billion would be expended each year in climate finance for developing countries to move forward with green technologies, with further climate financing to be advanced in the years beyond

It should be noted that there both legally binding and voluntary elements contained within the Paris Agreement. Specifically, the submission of an emissions reduction target and the regular review of that goal would be legally mandatory for all countries. Stated differently, there would be a system in place by which experts would be able to track the carbon-cutting progress of each country. At the same time, the specific targets to be set by countries would be determined at the discretion of the countries, and would not be binding. While there was some criticism over this non-binding element, the fact of the matter was that the imposition of emissions targets was believed to be a major factor in the failure of climate change talks in Copenhagen, [Denmark](#), in 2009.

In 2015, the talks faced challenges as several countries, such as [China](#) and [India](#), objected to conditions that would stymie economic and development. In order to avoid that kind of landmine, a system Intended Nationally Determined Contributions (INDCs) was developed and formed the basis of the accord. As such, the Paris Agreement would, in fact, facilitate economic growth and development, as well as technological progress, but with the goal of long-term ecological sustainability based on low carbon sources. In fact, the agreement heralded as "the beginning of the end of the fossil fuel era." As noted by Nick Mabey, the head of the climate diplomacy organization E3G, said, "Paris means governments will go further and faster to tackle climate change than ever before. The transition to a low carbon economy is now unstoppable, ensuring the end of the fossil fuel age."

A particular sticking point in the agreement was the \$100 billion earmarked for climate financing for developing countries to transition from traditional fossil fuels to green energy technologies and a low carbon future. In 2014, a report by the International Energy Agency indicated that the cost of that transition would actually be around \$44 trillion by the mid-century -- an amount that would render the \$100 billion being promised to be a drop in the proverbial bucket. However, the general expectation was that the Republican-controlled Senate in the [United States](#), which would have to ratify the deal in that country, was not interested in contributing significant funds for the cause of climate change.

A key strength of the Paris Agreement was the ubiquitous application of measures to all countries. Of note was the frequently utilized concept of "flexibility" with regard to the Paris Agreement. Specifically, the varying capacities of the various countries in meeting their obligations would be

anticipated and accorded flexibility. This aspect presented something of a departure from the 1997 Kyoto Protocol, which drew a sharp distinction between developed and developing countries, and mandated a different set of obligations for those categories of countries. Thus, under Kyoto, [China](#) and [India](#) were not held to the same standards as the [United States](#) and European countries. In the Paris Agreement, there would be commitments from all countries across the globe.

Another notable strength of the Paris Agreement was the fact that the countries of the world were finally able to reach consensus on the vital necessity to limit global temperature increases to 1.5 degrees Centigrade. Ahead of the global consensus on the deal, and as controversy continued to surface over the targeted global temperature limits, the leaders of island countries were sounding the alarm about the melting of the Polar ice caps and the associated rise in sea level. Prime Minister Enele Sopoaga of [Tuvalu](#) issued this dismal reminder: "Tuvalu's future ... is already bleak and any further temperature increase will spell the total demise of [Tuvalu](#). No leader in this room carries such a level of worry and responsibility. Just imagine you are in my shoes, what would you do?" It was thus something of a victory for environmental advocates that the countries of the world could find consensus on the lower number -- 1.5 degrees rather than 2 degrees.

A significant weak point with regard to the Paris deal was a "loss and damage" provision, which anticipates that even with all the new undertakings intended to reduce greenhouse gas emissions and move to a low carbon future, there would nonetheless be unavoidable climate change consequences. Those consequences ranged from the loss of arable land for farmers as well as soil erosion and contamination of potable water by sea water, to the decimation of territory in coastal zones and on small islands, due to the rise in sea level, with entire small island countries being rendered entirely uninhabitable. The reality was that peoples' homes across the world would be destroyed along with their way of life.

With that latter catastrophic effect being a clear and present danger for small island countries, the Association of Small Island States (AOSIS) demanded that the developed world acknowledge its responsibility for this irreversible damage.. Despite the fact that greenhouse gas emissions and the ensuing plague of global warming was, indeed, the consequence of development in the West (the [United States](#) and Europe) and the large power house countries, such as [Russia](#), [China](#) and [India](#), there was no appetite by those countries to sign on to unlimited liability. Under the Paris Agreement, there was a call for research on insurance mechanisms that would address loss and damage issues, with recommendations to come in the future.

The call for research was being regarded as an evasion of sorts and constituted the weakest aspect of the Paris Agreement. Not surprisingly, a coalition of small island nations demanded a "Marshall Plan" for the Pacific. Borrowing the term "Marshall Plan" from the post-World War II reconstruction effort, the coalition of Pacific island nation, which included [Kiribati](#), [Tuvalu](#), [Fiji](#), and the [Marshall Islands](#), called for an initiative that would include investment in renewable energy

and shoreline protection, cultural preservation, economic assistance for economies in transition, and a plan for migration and resettlement for these countries as they confront the catastrophic effects of the melting of the Polar ice caps and the concomitant rise in sea level. The precise contours of the initiative remained unknown, unspecified, and a mere exercise in theory at the time of writing. Yet such an initiative would, at some point, have to be addressed, given the realities of climate change and the slow motion calamity unfolding each day for low-lying island nations across the world.

As noted by Vice President Greg Stone of Conservation International, who also functions as an adviser to the government of [Kiribati](#), “Imagine living in a place where you know it’s going to go away someday, but you don’t know what day that wave’s going to come over and wash your home away.” He added, “It’s a disaster we know is going to happen.” Meanwhile, the intervening years promised to be filled with hardship for small island nations, such as [Kiribati](#). Stone explained, “For every inch of sea-level rise, these islands lose 10 feet of their freshwater table to saltwater intrusion,” Stone explained. “So it’s not just about the day the water finally goes over the island; it’s also about the day that there’s just not enough water left and everyone has to move off the island.” Presaging the future for island nations that could face submersion, Stone said, “If you look ahead 50 years, a country like [Kiribati](#) could become the first aqueous nation. possibility of migration. That is, they own this big patch of ocean, and they administer it from elsewhere.”

Foreign Minister Minister Tony Debrum of the [Marshall Islands](#) emerged as the champion advocating on behalf of small island nation states and a loose coalition of concerned countries from the Pacific to the Caribbean, but with support from the [United States](#). He addressed the comprehensive concerns of small island nations regarding the weaknesses of the deal, while simultaneously making clear that the Paris Agreement signified hope for the countries most at risk. In a formal statement, Debrum declared: “We have made history today. Emissions targets are still way off track, but this agreement has the tools to ramp up ambition, and brings a spirit of hope that we can rise to this challenge. I can go back home to my people and say we now have a pathway to survival.” Debrum highlighted the imperatives of Pacific island nations, saying, “Our High Ambition Coalition was the lightning rod we needed to lift our sights and expectations for a strong agreement here in Paris. We were joined by countries representing more than half the world. We said loud and clear that a bare-bones, minimalist agreement would not fly. We instead demanded an agreement to mark a turning point in history, and the beginning of our journey to the post-carbon era.”

Debrum of the [Marshall Islands](#) espoused the quintessential synopsis of the accord and its effects for those most likely to be affected by climate change as he noted, “Climate change won’t stop overnight, and my country is not out of the firing line just yet, but today we all feel a little safer.”

Editor's Entry on [Environmental Policy](#):

---

The low-lying Pacific island nations of the world, including [Kiribati](#), [Tuvalu](#), the [Marshall Islands](#), [Fiji](#), among others, are vulnerable to the threats posed by global warming and climate change, derived from carbon emissions, and resulting in the rise in sea level. Other island nations in the Caribbean, as well as poor countries with coastal zones, were also at particular risk of suffering the deleterious effects of climate change.

Political policy in these countries are often connected to ecological issues, which have over time morphed into an existential crisis of sorts. Indeed, ecological concerns and the climate crisis have also been dominant themes with life and death consequences for the people of island nations in the Pacific. Indeed, the very livelihoods of fishing and subsistence farming remain at risk as a result of ecological and environmental changes. Yet even so, these countries are threatened by increasingly high storm surges, which could wipe out entire villages and contaminate water supplies. Moreover, because these are low lying island nations, the sustained rise in sea level can potentially lead to the terrain of these countries being uninhabitable at best, and submerged at worst. Stated in plain terms, these countries are at severe risk of being obliterated from the map and their plight illuminates the emerging global challenge of environmental refugees. In these manifold senses, climate change is the existential crisis of the contemporary era.

Since the time of the 1997 Kyoto Protocol, there have been efforts aimed at extending the life of that agreement, with an eye on minimizing greenhouse gas emissions, and thus minimizing the effects of climate change. Those endeavors have largely ended in failure, as exemplified by the unsuccessful Copenhagen talks in 2009 and the fruitless Doha talks in 2012 respectively. The success of the COP 21 talks in [France](#), with the adoption of the landmark Paris Agreement in 2015, was regarded as the first glimmer of hope. Not only did the Paris Agreement signify the triumph of international diplomacy and global consensus, but it also marked the start of the end of the fossil fuel era, with the path forward toward a low carbon future reliant on greener technologies. Most crucially, the Paris Agreement stood as the first significant response in recent times to the central challenge of climate change and its quotidian effects on the lives of real human beings across the world.

## **1. Major International Environmental Accords:**

### **General Environmental Concerns**

Convention on Environmental Impact Assessment in a Transboundary Context, Espoo, 1991.

### **Accords Regarding Atmosphere**

---

Annex 16, vol. II (Environmental Protection: Aircraft Engine Emissions) to the 1044 Chicago Convention on International Civil Aviation, Montreal, 1981

Convention on Long-Range Transboundary Air Pollution (LRTAP), Geneva, 1979

United Nations Framework Convention on Climate Change (UNFCCC), New York, 1992

Vienna Convention for the Protection of the Ozone Layer, Vienna, 1985 including the Montreal Protocol on Substances that Depleted the Ozone Layer, Montreal, 1987

### **Accords Regarding Hazardous Substances**

Convention on the Ban of the Import into Africa and the Control of Transboundary Movements and Management of Hazardous Wastes within Africa, Bamako, 1991

Convention on Civil Liability for Damage Caused during Carriage of Dangerous Goods by Road, Rail and Inland Navigation Vessels (CRTD), Geneva, 1989

Convention on the Control of Transboundary Movements of Hazardous Wastes and their Disposal (Basel Convention), Basel, 1989

Convention on the Transboundary Effects of Industrial Accidents, Helsinki, 1992

Convention to Ban the Importation into Forum Island Countries of Hazardous and Radioactive Wastes and to Control the Transboundary Movement and Management of Hazardous Wastes within the South Pacific Region (Waigani Convention), Waigani, 1995

European Agreement Concerning the International Carriage of Dangerous Goods by Road (ADR), Geneva 1957

FAO International Code of Conduct on the Distribution and Use of Pesticides, Rome, 1985

## **2. Major International Marine Accords:**

### **Global Conventions**

Convention on the Prevention of Marine Pollution by Dumping of Wastes and Other Matter (London Convention 1972), London, 1972

International Convention for the Prevention of Pollution from Ships, 1973, as modified by Protocol of 1978 relation thereto (MARPOL 73/78), London, 1973 and 1978

International Convention on Civil Liability for Oil Pollution Damage 1969 (1969 CLC), Brussels, 1969, 1976, and 1984

International Convention on the Establishment of an International Fund for Compensation for Oil Pollution Damage 1971 (1971 Fund Convention), Brussels, 1971

Convention on Liability and Compensation for Damage in Connection with the Carriage of Hazardous and Noxious Substances by Sea (HNS), London 1996

International Convention on Oil Pollution Preparedness, Response, and Co-operation (OPRC), London, 1990

International Convention Relation to Intervention on the High Seas in Cases of Oil Pollution Casualties (Intervention Convention), Brussels, 1969

United Nations Convention on the Law of the Sea (UNCLOS), Montego Bay, 1982

### **Regional Conventions**

Convention for the Prevention of Marine Pollution by Dumping from Ships and Aircraft (Oslo Convention), Oslo, 1972

Convention for the Prevention of Marine Pollution from Land-based Sources (Paris Convention), Paris, 1974

Convention for the Protection of the Marine Environment of the North East Atlantic (OSPAR Convention), Paris, 1992

Convention for the Protection of the Marine Environment of the Baltic Sea Area (1974 Helsinki Convention), Helsinki 1974

Convention for the Protection of the Marine Environment of the Baltic Sea Area (1992 Helsinki Convention), Helsinki 1992

Conventions within the UNEP Regional Seas Programme

Convention on the Protection of the Black Sea against Pollution, Bucharest, 1992

Convention for the Protection and Development of the Marine Environment of the Wider Caribbean Region, Cartagena de Indias, 1983

Convention for the Protection, Management, and Development of the Marine and Coastal Environment of the Eastern African Region, Nairobi, 1985

Kuwait Regional Convention for Co-operation on the Protection of the Marine Environment from Pollution, [Kuwait](#), 1978

Convention for the Protection and Development of the Marine Environment and Coastal Region of the Mediterranean Sea (Barcelona Convention), Barcelona, 1976

Regional Convention for the Conservation of the Red Sea and Gulf of Aden Environment, Jeddah, 1982

Convention for the Protection of the Natural Resources and Environment of the South Pacific Region, Noumea, 1986

Convention for the Protection of the Marine Environment and Coastal Area of the South-East Pacific, Lima, 1981

Convention for Co-operation in the Protection and Development of the Marine and Coastal Environment of the West and Central African Region, Abidjan, 1981

### **3. Major Conventions Regarding Living Resources:**

### Note on Edition Dates:

The earlier edition dates are noted above because they were used to formulate the original country reviews and serve as the baseline for some of the information covered. Later editions have been used in some cases, and are cited as such, while other more recent online resources (cited above) contain recent and ever-updated data sets used for research.

### Methodology Notes for Economic Data:

Estimates by CountryWatch.com of GDP in dollars in most countries are made by converting local currency GDP data from the International Monetary Fund World Economic Outlook to US dollars by market exchange rates estimated from the International Monetary Fund International Financial Statistics and projected out by the CountryWatch Macroeconomic Forecast. Real GDP was estimated by deflating current dollar values by the US GDP Implicit Price Deflator.

Exceptions to this method were used for:

- Bosnia-Herzegovina
- Nauru
- Cuba
- Palau
- Holy See
- San Marino
- Korea, North
- [Serbia](#) & Montenegro
- Liberia
- Somalia
- Liechtenstein
- Tonga
- Monaco
- Tuvalu

In these cases, other data and/or estimates by CountryWatch.com were utilized.

Later editions have been used in some cases, and are cited as such, while other more recent online resources (cited above) contain recent and ever-updated data sets used for research.

#### Methodology Notes for the HDI:

Since 1990, the United Nations Development Programme, in concert with organizations across the globe, has produced the [Human Development Index](#) (or HDI). According to the UNDP, the index measures average achievement in basic human development in one simple composite index, and produces from this index a ranking of countries. The HDI is a composite of three basic components of human development: longevity, knowledge and standard of living. Longevity is measured by life expectancy. Knowledge is measured by combination of adult literacy and mean

years of schooling. Standard of living is measured by purchasing power, based on real GDP per capita (in constant US\$) adjusted for differences in international living costs (or, purchasing power parity, PPP). While the index uses these social indicators to measure national performance with regard to human welfare and development, not all countries provide the same level of information for each component needed to compute the index; therefore, as in any composite indicator, the final index is predicated on projections, predictions and weighting schemes. The index is a static measure, and thus, an incomplete measure of human welfare. In fact, the UNDP says itself the concept of human development focuses on the ends rather than the means of development and progress, examining in this manner, the average condition of all people in a given country.

Specifically, the index is calculated by determining the maximum and minimum for each of the three components (as listed above) and then measuring where each country stands in relation to these scales-expressed as a value between 0 and 1. For example, the minimum adult literary rate is zero percent, the maximum is 100 percent, and the reading skills component of knowledge in the HDI for a country where the literacy rate is 75 percent would be 0.75. The scores of all indicators are then averaged into the overall index.

For a more extensive examination of human development, as well as the ranking tables for each participating country, please visit: <http://www.undp.org>
