Country Overview

Country Overview

KIRIBATI

Kiribati won independence from the United Kingdom in 1979. Like other Pacific island countries, Kiribati is far from major markets, has few natural resources and a narrow economic base. Production and exports are limited to copra, fish and seaweed, and the economy is vulnerable to fluctuations in world commodity demand and prices.

Once known as the Gilbert Islands, Kiribati is made up of 33 coral atolls and sits amidst two million square miles of Pacific Ocean. With its highest point only six feet above sea level, Kiribati has been particularly vulnerable to the rise of sea level as a result of global climate change.

In Kiribati, ecological concerns and the climate crisis have also been dominant themes with life and death consequences for the people of Kiribati. Indeed, their very livelihoods of fishing and subsistence farming remain at risk as a result of ecological and environmental changes. Yet even so, Kiribati is threatened by increasingly high storm surges, which could wipe out entire villages and contaminate water supplies. Accordingly, Kiribati's very existence is thus at severe risk of being obliterated from the map.

Not surprisingly, policies in Kiribati have centered on emergency planning for worst case scenarios in this vulnerable country. Yet with the existential threat of being wiped off the map in the offing, Kiribati's government has concluded that the people will have to choose but to leave the islands and it has called on the international community to assist in this regard. This call has come after years of attempting to draw international attention to the plight of global climate change and its dire consequences for small island states.

Note: The case of Kiribati illuminates the emerging global challenge of environmental refugees

Editor's Note on Environment:

Like so many small island nations in the world, Kiribati is vulnerable to the threats posed by global warming and climate change, derived from carbon emissions, and resulting in the rise in sea level. Political policy in the country is often connected to ecological issues, which have over time morphed into an existential crisis of sorts.

Indeed, in most small island countries not just in the Pacific, but also the Caribbean and Indian Ocean, ecological concerns and the climate crisis have been dominant themes with dire life and death consequences looming in the background for their people. Small island nations in these region are already at risk from the rise of sea-level, tropical cyclones, floods. But their very livelihoods of fishing and subsistence farming were also at risk as a result of ecological and environmental changes. Increasingly high storm surges can wipe out entire villages and contaminate water supplies. Accordingly, the very existence of island are at severe risk of being obliterated from the map. Yet even with the existential threat of being wiped off the map in the offing, the international community has been either slow or restrictive in its efforts to deal with global warming, climate change, economic and ecological damage, as well as the emerging global challenge of environmental refugees.

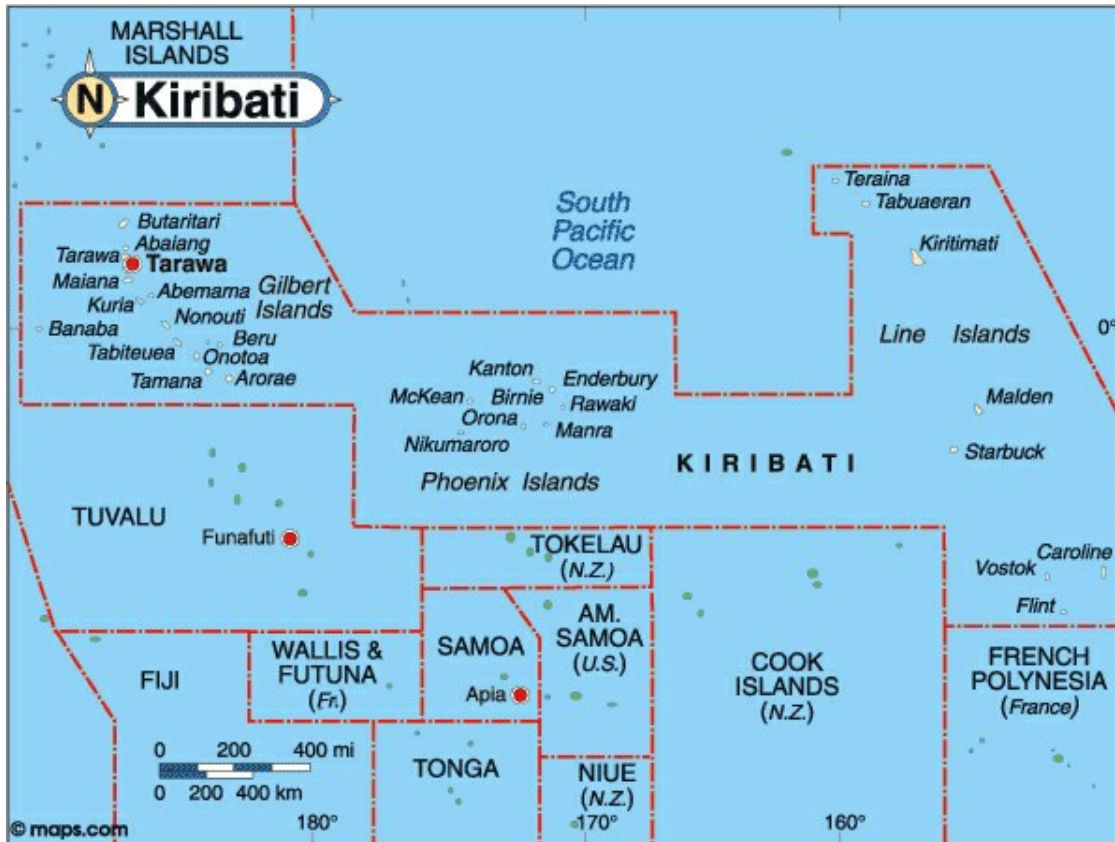

A 2012 report from the United Nations Environment Program (UNEP) and the Pacific Regional Environment Program underlined the concerns of small island nations and their people as it concluded that the livelihoods of approximately 10 million people in Pacific island communities were increasingly vulnerable to climate change. In fact, low-lying islands in that region would likely confront losses of up to 18 percent of gross domestic product due to climate change, according to the report. The report covers 21 countries and territories, including Fiji, Kiribati, Samoa and Tonga, and recommended environmental legislation intended to deal with the climate crisis facing the small island countries particularly. As noted by David Sheppard, the director general of the Pacific Regional Environment Program that co-sponsored this study: "The findings... emphasize the need more than ever to raise the bar through collective actions that address the region's environmental needs at all levels."

Key Data

Key Data	
Region:	Pacific Islands
Population:	105711
Climate:	Tropical; marine, hot and humid, moderated by trade winds.

Chapter 2

Political Overview

History

The first recorded European encounter with Kiribati was by the Spanish explorer Quiros in 1606. By the 1820s, all of the islands had been charted. At that time, the Russian hydrographer A.I. Krusenstern gave the group the name Gilbert Islands. Until about 1870, many British and American whaling vessels hunted for sperm whales in area waters, eventually depleting the stock. Starting in 1850, trading vessels passed through, seeking first coconut oil and then copra.

In the 1860s, "black-birders" (slave ships) carried off islanders to work on plantations in Peru and, later, in Fiji, Tahiti, Hawaii and Australia. Not only did this practice reduce the number of men on the islands, it also introduced European diseases such as measles, against which the islanders had little resistance. With the people's consent, the Ellice Islands (now Tuvalu) and the Gilbert Islands (now Kiribati) became a British protectorate in 1892, in the hope of eradicating slave raids and incessant tribal warfare.

In 1900, phosphate was discovered on Ocean Island. This sparked a surge of British interest in the area, and more islands were placed under the British protectorate. Phosphate was the predominant source of income for Kiribati until 1979, when deposits were exhausted.

Japan seized the islands in 1941. On Nov. 21, 1943, American forces launched their first penetration of Japan's ring of island defenses by attacking the Tarawa islet of Betio. Tarawa Atoll was the setting for one of the bloodiest battles in the Pacific and was a major turning point in the war for the Allies.

One of the most important post-war moves in the main islands was the strengthening of the islanders' economic cooperatives. New rules made it unprofitable for overseas trading firms to re-establish themselves. I-Kiribati gained a stronger voice in the affairs of the colony during the 1950s and 1960s, when an advisory council and, later, the House of Assembly with powers of recommendation were created. In 1974, the colony moved forward to a ministerial form of government.

In 1975, the Ellice Islands seceded from the colony and became the independent nation of Tuvalu. On July 12, 1979, Kiribati obtained its own independence from the United Kingdom and became a republic within the British Commonwealth.

Note on History: In certain entries, open source content from the State Department Background Notes and Country Guides have been used. A full listing of sources is available in the Bibliography.

Political Conditions

Political Chronology

A divisive political issue in [Kiribati](#) has been a protracted bid by the residents of Banaban Island to secede and have their island placed under the protection of [Fiji](#). The government's attempts to placate the Banabans include specific provisions in the constitution, such as giving them a seat in the House of Assembly and returning to them land on Banaban acquired by the government for phosphate mining.

In terms of political developments, elections for the house of assembly were last in late September 1998. non-partisan candidates took 15 seats and the Maneaaban te Mauri Party (MTM) won 14 seats while the Boutokanto Koaua Party (BKP) won 11. (Note: Maneaban Te Mauri translates into Protect the Maneaba and Boutokan Te Koaua translates into Pillars of Truth.)

President Teburoro Tito was re-elected in the presidential election of Nov. 27, 1998. He won 52.3 percent of the vote, followed by Harry Tong with 45.8 percent. Amberoti Nikora of the Boutokanto Koaua Party received 1.8 percent.

The [Kiribati](#) government received some negative press concerning illicit activity by officials. In early 1999, there was a dispute when the opposition asserted that cabinet ministers were receiving preferential treatment from public utilities companies. It was revealed that some ministers had outstanding electric bills of up to \$800. More recently the North Tarawa Member of Parliament, John Kumkee, was fined and sentenced to four years in prison for bribery and customs evasion. Kumkee appealed and remained in office for three months, but his appeals were ultimately rejected.

A dispute between the [Kiribati](#) Overseas Seamen's Union (KIOSU) and the German-owned firm South Pacific Marine Services (SPMS) over wages and contracts began in May 1999 and was finally resolved amidst controversy in September. The KIOSU accused SPMS of paying lower wages to I-Kiribati seamen than required by the International Transport Workers Federation (ITWF). The Ministry of Labor denied that the seamen were treated unfairly.

After a few months of negotiations, SPMS agreed to pay a better wage with a longer-term contract. The government then accused the ITWF and KIOSU of not acting on behalf of the seamen in the wage negotiations with the SPMS. The KIOSU claimed that it was fully involved with the negotiations and retaliated by claiming that the government had made the allegations to cover up its own complicity in the exploitation of I-Kiribati seamen.

In November 1999 the Ministry of Education announced a plan to implement nine years of free education for all children. The plan included the establishment of 18 junior secondary schools by 2001.

The International Monetary Fund (IMF) voiced its approval of the government's economic policies in October 1999. While the IMF was impressed with Kiribati's ability to increase growth and maintain low inflation, the organization recommended that the government reduce trade barriers and encourage foreign investment, improve the infrastructure, reduce reliance on the public service as a source of employment and promote the private sector. The IMF also called for health education, improved social welfare services and measures to improve environmental protection.

Shortly before the IMF called for the reduction of trade barriers, [Kiribati](#) had voiced opposition to a proposed free-trade zone in the South Pacific. President Tito referred to free trade as a form of colonization that had few benefits for a small nation. Tito feared that the nation would lose control over what goods would be imported and that its natural resources would be threatened. As an alternative he proposed the encouragement of small businesses and the continuation of bilateral agreements between neighboring countries. The free-trade zone proposal presented at the South Pacific Forum called for a gradual reduction of import duties over the course of eight years.

President Tito's government faced more criticism in late 1999 for interfering with the media. Michael Field, a reporter for Pacific Islands Monthly, was banned from the country in late 1999 after writing several articles critical of Kiribati's environmental damage and development level. Reporters Sans Frontières, an international journalists' organization that campaigns against press restrictions, called on the government to lift the ban in early December. Former President Ieremia Tabai was fined in December 1999 for attempting to broadcast on an FM radio station without a license. This was seen by some as an attempt to prevent the airing of opposition voices.

In May 2000, Tabai and some associates launched publication of a weekly independent newspaper, intended to compete with the existing government-owned paper, also a weekly.

Meanwhile, in 1995 [Kiribati](#) unilaterally moved the International Date Line eastward to consolidate all of its 33 islands on the same side, a change that all nations subsequently accepted. This shift also enabled [Kiribati](#) to claim that it would be the first country to greet the arrival of the year 2000.

The government spent about US\$600,000 preparing for festivities, including the construction of

permanent facilities on its easternmost point, renamed Millennium Island. President Tito admitted after the event that tourist arrivals were light, and the endeavor's balance sheet was in the red. But he maintained that the effort generated worthwhile publicity that would pay off with stronger tourism to [Kiribati](#) in the long run. Opposition politicians countered that the funds would have been better spent on basic services such as education and public health.

In major announcement in March 2000, Japan's space agency finalized its choice of Kiribati's Christmas Island as the landing base for an unmanned shuttle; the spacecraft will blast off from southern [Japan](#). Over the next three years [Japan](#) will spend about US\$12.9 million to develop the necessary infrastructure. The maiden space voyage of the craft, named HOPE-X, will take place in 2004. Environmentalists have raised some concerns about the project because Christmas Island is a key nesting site for millions of seabirds, which are both of scientific interest and a resource in Kiribati's efforts to promote eco-tourism. Christmas Island also contains archeological sites providing important clues in the rediscovery of Oceania's prehistory.

In their attempts to mount an effective challenge to the government, the [Kiribati](#) opposition parties suffer from a major handicap. The media has become increasingly controlled by the government (see above) and hence, it is severely limiting the reach of the opposition parties to the people. Former President Ieremia Tabai, who is now an opposition member of the house, has been trying to start a radio station in [Kiribati](#) for several years now but has not yet succeeded. In 1999, Tabai was fined by a [Kiribati](#) court for trying to import broadcast equipment into [Kiribati](#) without having the necessary licenses for the same. Tabai accused the government of trying to suffocate the opposition and deny them the right to propagate their own views.

In May 2000, the opposition parties scored a significant victory over the government in their battle for the control of media in the country. The government faced challenge from a new direction when the opposition launched its own newspaper to challenge the government newspaper that had so far a monopoly over the country. [Kiribati](#) New Star, a newsweekly, hit the streets in May 2000, positioned opposite Te Uekera, the government-owned weekly newsmagazine. The New Star is owned by former President Tabai and two other [Kiribati](#) nationals. The newsweekly promised investigative reporting, specially on the issues which the government run magazine does not cover.

In May 2000, [Kiribati](#) signed an agreement with [New Zealand](#) covering the financial aid that [New Zealand](#) will provide to [Kiribati](#) over the financial year 2000-2001 which began in June 2000. Under the agreement, [New Zealand](#) agreed to provide about \$2 million for various development projects in [Kiribati](#), including health and gender activities. [New Zealand](#) also agreed to continue the current provision where by [New Zealand](#) receives patients from [Kiribati](#) who can not be treated in local hospitals.

By 2002, [Kiribati](#) and many other small Pacific island nation states were faced with the disturbing environmental consequences of climate change. In recent academic studies, attention has been

focused on the threat to island coastal areas as temperatures increase, polar ice caps melt and sea level rises as a result. The impact upon small island nations around the world is potentially dangerous.

Until recently, less attention has been given the more immediate effect, which is the matter of freshwater quality and availability. At present, between 50 and 70 percent of the residents of [Samoa](#) have access to safe and drinkable water; in [Kiribati](#) and [Tuvalu](#), the number drops to less than 45 percent. Other island nations, such as the [Marshall Islands](#) and [Micronesia](#) have had to deal with droughts and as rainwater or groundwater are their only freshwater resources, the effects on the population in the region is potentially dangerous. With global warming, droughts are predicted to increase along with the possibility of water shortages; the loss of freshwater resources could cause island nations such as [Kiribati](#) and [Tuvalu](#) to be uninhabitable.

Meanwhile, islands such as [Kiribati](#) are under threat of being washed away if increases in sea level continue, as a consequence of global warming. Some studies suggest that these islands could cease to exist in 50 years as a result of climate change. Indeed, in 1999, it was reported that two islands - - Tebua Tarawa and Abanuea - (which, interestingly translates in meaning to "the beach which is long-lasting") disappeared as a result of rising seas. Both islands, which were part of [Kiribati](#), were not inhabited, however, they were used at times by fishermen.

The pollution caused by developed countries has become a major bone of contention in the view of small Pacific island states. In this regard, the leaders of [Kiribati](#), [Tuvalu](#) and [Maldives](#), intend to launch a lawsuit and other legal measures against polluting countries. Because of its close proximity, [Australia](#) is one of the first countries targeted for legal action, which will be decided in the International Court of Justice (ICJ). Because [Australia](#) accepts ICJ jurisdiction, it is considered to be a prime target in such lawsuits.

The need for transnational policy on the matter is urgent; however, the countries of this region have very little leverage in the international sphere, especially since the [United States](#) and [Australia](#) have refused to ratify the Kyoto Protocol. Environmental issues of this sort are becoming the primary concern of the people and policy-makers in Pacific countries. Resultantly, in March 2002, [Kiribati](#) announced its joint decision with [Tuvalu](#) and the [Maldives](#) to pursue legal action against the [United States](#) for refusing to sign the Kyoto Protocol and to participate within the Kyoto system.

The frustration felt by the leaders of [Kiribati](#) has also been illustrated by the critical comments made by the heads of the Roman Catholic and Protestant churches in [Kiribati](#). Bishop Paul Mwea of the Roman Catholic church and Baiteke Nabetari of the Protestant Church accused industrialized nations of causing global warming and the resulting rise of sea level by developing their economies with new technologies, while detrimentally affecting the mere existence of smaller and poorer countries. They also noted that biodiversity, such as marine resources, is being depleted because of overfishing and other such practices aimed at Western-style economic development.

Meanwhile, elections in [Kiribati](#) were scheduled for the second half of 2002. The first round of legislative elections were held in November 2002 and the second round of elections were held a month later in December 2002. In those elections, BTK won 17 seats, MTM won 16 seats, independents garnered seven seats.

In March 2003, the parties in parliament selected candidates for the presidential election. The result was that Teburoro Tito became president and began his third term as president. His tenure, however, lasted no more than one day as he was ousted from office in a non-confidence vote.

Two months later, new legislative elections were held. Both rounds were held in May 2003. MTM secured a victory with 24 seats while BTK obtained 16 seats. With the results of the legislative elections finalized, the parties in parliament selected candidates for presidential elections.

Presidential elections then followed in July 2003. In the presidential elections, Anote Tong defeated his brother, Harry Tong, to secure the presidency. Final results were as follows: Anote Tong of BTK -- 47.4 percent, Harry Tong of MTM -- 43.5 percent, Banuera Berina of Maurin [Kiribati](#) Pati -- 9.1 percent.

In 2004, Kiribati's main issue was a dispute with [China](#) following the decision by the government of the Pacific island to establish diplomatic ties with Taiwan. Because [China](#) adheres to a "One-China" policy and claims jurisdiction over Taiwan, and because Taiwan rejects this claim, the issue of diplomatic ties with Taiwan has been contentious. Many countries, such as the [United States](#), although sympathetic to Taiwan, have resisted making official diplomatic ties with the country out of concern that such measures would serve only to ratchet up relations between the mainland and Taiwan. Thus, the decision by [Kiribati](#), under the government of President Tong, to establish such relations was regarded as surprising.

Upon making the decision to establish its allegiance with Taiwan, [Kiribati](#) asked [China](#) to withdraw its diplomatic personnel. The Chinese government in Beijing, however, refused to comply.

The decision to raise the ire of Beijing may be generally regarded as risky, but for President Tong, it was surmised that he may be prepared to take the risk for the purpose of advancing Kiribati's economy. Several small countries that have similarly recognized Taiwan have benefited from grants and other business incentives from Taiwan.

Nevertheless, President Tong announced in August 2004 that he believed Beijing was attempting to destabilize his government as a measure of retribution for its decision to establish ties with Taiwan. The president's brother, Harry Tong, who is also the opposition leader (mentioned above), expressed his belief that the real threat to [Kiribati](#) was Taiwan, rather than [China](#).

In 2006, attention was on the environment when [Kiribati](#) created a marine reserve, which gained the distinction of being the third largest in the world. Because the Phoenix Islands Protected Area is the habitat of a plethora of species of fish and coral, fishing was prohibited in its waters.

In August 2007, general elections were held in [Kiribati](#). Issues such as education and employment factored highly in the pre-election discussion. At the same time, ecological concerns and the climate crisis have also been dominant pre-election themes with life and death consequences for the people of [Kiribati](#) who live on more than 30 coral atolls in the Pacific, and who would clearly be affected by rising sea levels. Indeed, their very livelihoods of fishing and subsistence farming remain at risk as a result of ecological and environmental changes. Yet even so, [Kiribati](#) is threatened by increasingly high storm surges, which could wipe out entire villages and contaminate water supplies. As such, policies have also centered on emergency planning for worst case scenarios in this vulnerable country.

Voters went to the polls on Aug. 22, 2007 while 146 candidates were contesting the election for the 44-seat parliament. Most candidates represented either the ruling BTK or opposition MTM parties. After the polls closed, vote counting commenced. President Aote Tong retained his parliamentary seat, according to early election results. However, as time passed, it was clear that results of several other seats would be undecided after the first round, essentially requiring a second run-off round to determine ultimate results. That second round election was set for Aug. 30, 2007.

After the parliamentary elections, the focus was expected to shift to the presidential race. The president of [Kiribati](#) is chosen by popular vote from a list of candidates nominated by the parliament following the general election. To that end, the president was re-elected easily and with a decisive majority.

In June 2008, at an address for World Environment Day, President Aote Tong called for assistance in evacuating the citizens of [Kiribati](#) as it disappears due to climate change and the concomitant rise in sea level. President Tong noted that with the rise of sea level, salt water was encroaching on water supplies, land was being eroded, crops were being destroyed, and communities were being forced to move further inland. With the country at risk of being completely submerged, the people may eventually have no choice but to leave.

To this end, President Tong said, "We may be beyond redemption," he said. "We may be at the point of no return, where the emissions in the atmosphere will carry on contributing to climate change, to produce a sea level change so in time our small, low-lying islands will be submerged."

The executive director of the United Nations Environment Program, Achim Steiner, described Kiribati's environmental crisis as follows: "It's a humbling prospect when a

nation has to begin talking about its own demise, not because of some inevitable natural disaster... but because of what we are doing on this planet." Steiner called for "collective purpose" to combat global climate change.

In 2009, the United Nations' General Assembly convened in New York with Pacific island leaders continuing their call for global action on climate change. According to Radio [Australia](#), several Pacific leaders and representatives addressed the United Nations General Assembly, with all of them demanding greater understanding of the effects of climate change on their island nations, which are particularly vulnerable to the rise in sea level. Indeed, this issue represents an existential crisis for these Pacific island countries. In addition, they called on the developed world to use the upcoming climate change meeting in Copenhagen -- scheduled for December 2009 -- to adopt policies that would reduce carbon emissions.

In particular, Kiribati's President Anote Tong said all countries should accept responsibility for the effects of climate change. He said, "And I fear our children and grandchildren will look back and ask us the question - how is it they knew what they knew and yet they did so little." He continued, "Let us not waste any more time on talk, drafting amendments, posturing and empty platitudes. We know what needs to be done. This might be our last chance."

In December 2009, the United Nations Climate Change Summit opened in the Danish capital of Copenhagen. The summit was scheduled to last from Dec. 7-18, 2009. Delegates from more than 190 countries were in attendance, and approximately 100 world leaders, including British Prime Minister Gordon Brown and [United States](#) President Barack Obama, were expected to participate. At issue was the matter of new reductions targets on greenhouse gas emissions by 2020.

On Dec. 9, 2009, four countries -- the [United Kingdom](#), [Australia](#), [Mexico](#) and [Norway](#) -- presented a document outlining ideas for raising and managing billions of dollars, which would be intended to help vulnerable countries dealing with the perils of climate change. Described as a "green fund," the concept could potentially help small island states at risk because of the rise in sea level. The "green fund" would fall under the rubric of the United Nations Framework Convention on Climate Change, for which developed countries have been committed to quantifying their emission reduction targets, and also to providing financial and technical support to developing countries.

On Dec. 11, 2009, [China](#) demanded that developed and wealthy countries in Copenhagen should help deliver a real agreement on climate change by delivering on their promises to reduce carbon emissions and provide financial support for developing countries to adapt to global warming. China's Vice Foreign Minister also emphasized the fact that climate change was "a matter of survival" for developing countries, and accordingly, such countries need wealthier and more developed countries to accentuate not only their pledges of emissions reduction targets, but also their financial commitments under the aforementioned United Nations Framework Convention on

Climate Change. To that end, scientists and leaders of small island states in the Indian Ocean, the Pacific Ocean and the Caribbean Sea, have highlighted the existential threat posed by global warming and the concomitant rise in sea level.

China and [India](#) were joined by [Brazil](#) and [South Africa](#) in the crafting of a draft document calling for a new global climate treaty to be completed by June 2010. Of concern has been the realization that there was insufficient time to find concurrence on a full legal treaty, which would leave countries only with a politically-binding text by the time the summit at Copenhagen closed. But Guyana's leader, President Bharrat Jagdeo, warned that the summit in [Denmark](#) would be classified as a failure unless a binding document was agreed upon instead of just political consensus. He urged his cohorts to act with purpose saying, "Never before have science, economics, geo-strategic self-interest and politics intersected in such a way on an issue that impacts everyone on the planet."

Likewise, [Tuvalu](#) demanded that legally binding agreements emerge from Copenhagen. Its proposal was supported by many of the vulnerable countries, from small island states and sub-Saharan Africa, all of whom warned of the catastrophic impact of climate change on their citizens. [Tuvalu](#) also called for more aggressive action, such as an amendment to the 1992 agreement, which would focus on sharp greenhouse gas emissions and the accepted rise in temperatures, due to the impact the rise in seas. The delegation from [Kiribati](#) joined the call by drawing attention to the fact that one village had to be abandoned due to waist-high water, and more such effects were likely to follow. Kiribati's Foreign Secretary, Tessie Lambourne, warned that the people of [Kiribati](#) could well be faced with no homeland in the future saying, "Nobody in this room would want to leave their homeland." But despite such impassioned pleas and irrespective of warnings from the Intergovernmental Panel on Climate Change that the rise in sea level from melting polar ice caps would deleteriously affect low-lying atolls such as such as [Tuvalu](#) and [Kiribati](#) in the Pacific, and the [Maldives](#) in the Indian Ocean, the oil-giant [Saudi Arabia](#) was able to block this move.

By Dec. 12, 2009, details related to a draft document prepared by Michael Zammit Cutajar, the head of the Ad-hoc Working Group on Long-Term Cooperative Action, were released at the Copenhagen climate conference. Included in the document were calls for countries to make major reductions in carbon emissions over the course of the next decade. According to the Washington Post, industrialized countries were called on to make cuts of between 25 percent and 40 percent below 1990 levels -- reductions that were far more draconian than the [United States](#) was likely to accept. As discussed above, President Obama had offered a provisional reduction target of 17 percent. The wide gap between the released draft and the United States' actual stated position suggested there was much more negotiating in the offing if a binding agreement could be forged, despite the Obama administration's claims that it was seeking greater engagement on this issue.

The division between developed and developing countries in Copenhagen reached new heights on

Dec. 14, 2009, when some of the poor and less developed countries launched a boycott at the summit. The move, which was spurred by African countries but backed by [China](#) and [India](#), appeared to be geared toward redirecting attention and primary responsibility to the wealthier and more industrialized countries. The impasse was resolved after the wealthier and more industrialized countries offered assurances that they did not intend on shirking from their commitments to reducing greenhouse gases. As a result, the participating countries ceased the boycott.

A parliamentary election was set to be held in [Kiribati](#) in October 2011. A first round was expected on Oct. 21, 2011, with a second round a week later on Oct. 28, 2011. At stake were the seats in the unicameral House of Parliament or "Maneaba Ni Maungatabu" composed of 46 seats. Forty-four members are elected by popular vote, there is one ex officio member - the attorney general, and one member is nominated by the Rabi Council of Leaders (representing Banaba Island) to serve four-year terms.

Note that voting on two islands in [Kiribati](#) was delayed until Oct. 24, 2011, due to delays in the delivery of ballot papers to Fanning Island and Washington Island. As noted by chief electoral officer, Rine Ueara, on the problem of delivering ballots to those two islands: "They're far from Christmas Island. They need the boat from Christmas Island to deliver the papers but [because of] problems with shipping lines the papers won't be there until Sunday. We won't be on counting on Fanning and Washington but all the results from other electoral districts will be transferred to the central office and they will be announced on that night." The second round of elections ensued on Oct. 28, 2011, as scheduled.

A presidential election was originally set to take place on Dec. 30, 2011, but later changed to Jan. 13, 2011. The presidential vote would occur in the aftermath of parliamentary elections, which were held in [Kiribati](#) in October 2011. In those elections, the incumbent President Anote Tong's Pillars of Truth secured 15 seats, the United Coalition Party of Tetaua Taitai took 10 seats, and the Maurin [Kiribati](#) Pati of Rimeta Beniamina won three seats, with the remainder going to independents.

With the parliamentary vote completed, the new composition of the incoming parliament would determine the winner of the presidential contest. Typically, the presidency is determined on the basis of the parliamentary election results. The president is elected to serve four-year terms. The incumbent president was Anote Tong, who has served since 2003 and was elected most recently during elections of 2007. Among the other candidates were Dr. Tetaua Taitai, and the previous parliament's opposition leader, Rimeta Beniamina.

The main issues at the heart of the 2012 presidential contest were Taiwanese and Chinese aid, copra prices and pensions.

Note that when the votes were counted, incumbent President Anote Tong won re-election with 42

percent of the total vote. Tetaui Taitai was his nearest challenger, securing 35 percent of the vote share. Rimeta Beniamina took 23 percent. Tong carried 14 out of the 23 constituencies but his overall vote tally was significantly less than the 64 percent landslide victory he enjoyed in 2007. Nevertheless, voter turnout in 2012 was high at 68 percent and the election was brought to a conclusion peacefully. President Anote Tong was officially sworn into office less than a week after winning a third term as the island nation's leader.

In March 2012, officials of [Kiribati](#) were in discussions aimed at purchasing land from another country due to the existential threat faced as a result of the rise of sea level in this low-lying Pacific nation state. To this end, Kiribati's President Anote Tong was considering the purchase of land on Vanua Levu -- Fiji's second largest island. The land would be used to resettle some citizens, to extract earth for sea defense from rising ocean water, and also for the production of crops.

As noted repeatedly by President Tong, climate change poses an existential threat to [Kiribati](#), with global warming contributing to the rise in sea level, and the encroachment onto inhabitable land in his country. He acknowledged that [Kiribati](#) would ultimately lose this battle and that his country had to be prepared to deal with all possibilities in the future, including moving his people to another destination -- the inherent difficulty of such an endeavor notwithstanding. [Kiribati](#) was also looking to other countries in the region, such as [Australia](#) and [New Zealand](#), in the hopes that they would accept some citizens of [Kiribati](#) for resettlement purposes. Another potential option being envisioned by the president was the construction of man-made islands akin to oil rigs upon which the citizens of [Kiribati](#) might live.

A parliamentary election was held in Kiribati in late 2015. A first round of voting was held on Dec. 30, 2015, with a second round following on Jan. 7, 2016 for contests where a given candidate failed to secure an outright majority. At stake were the seats in the unicameral House of Parliament or "Maneaba Ni Maungatabu" composed of 46 seats. In that legislative body, 44 members are elected by popular vote, there is one ex officio member -- the attorney general, and one member is nominated by the Rabi Council of Leaders (representing Banaba Island), to serve four-year terms.

A presidential election was set to take place in Kiribati in March 2016. The presidential vote would occur in the aftermath of parliamentary elections, which were to be held in Kiribati in two rounds in December 2015 and January 2016. With the parliamentary vote completed, the new composition of the incoming parliament, which would first sit in session in February 2016, would determine the winner of the presidential contest. Typically, the presidency is determined on the basis of the parliamentary election results. The president is elected to serve four-year terms. The incumbent president was Anote Tong who served as the head of state since 2003 and was elected most recently during elections of 2012. In 2016, President Tong, who was stepping away from the political field, was not going to be a presidential contender. Instead, the three main contenders for the presidency would be Rimeta Beniamina and Tianeti Ioane of the Boutokaan Te Koaua party,

which has controlled politics in Kiribati for some time, as well as Taaneti Mamau, the representative of an opposition coalition.

Environmental Note:

Small island countries announce plan to sue multinational fossil fuel corporations for their role in climate change --

In mid-2015, six small island nation states -- [Vanuatu](#), [Kiribati](#), [Tuvalu](#), [Fiji](#), [Solomon Islands](#) and [Philippines](#) -- released a manifesto on climate change. Dubbed the "People's Declaration for Climate Justice," the declaration announced a plan to sue large multinational fossil fuel corporations, which they blamed for carbon pollution, the degradation to their ecosystems, and the other deleterious effects of climate change. The highlights of the manifesto read as follows: "We, the people of [Vanuatu](#), [Kiribati](#), [Tuvalu](#), [Fiji](#), [Solomon Islands](#) and the [Philippines](#) continue to experience the impacts of climate change -- the single biggest human rights, environmental and humanitarian crisis of our time... As the people most acutely vulnerable to the impacts of climate change, we will not let the big polluters decide and assign our fate... We commit to holding those most responsible for climate change accountable. By doing so, we send a message of hope that the people and not the polluters are in charge of humanity's destiny. " In truth, the effort to sue the world's largest fossil fuel corporations would not be a simple endeavor and the plaintiff nation states might not even see their day in court; however, small island countries were not willing to silently accept the pressing environmental threat to their existence without seeking accountability.

Editor's Entry on [Environmental Policy](#):

Like so many small island nations in the world, [Kiribati](#) is vulnerable to the threats posed by global warming and climate change, derived from carbon emissions, and resulting in the rise in sea level. Political policy in the country is often connected to ecological issues, which have over time morphed into an existential crisis of sorts.

Please see the special section titled "Climate change talks in [Qatar](#) extend life of Kyoto Protocol" located in the entry titled "Global Environmental Agreements" in this Country Review for information on the December 2012 saw climate talks in the Qatari city of Doha. There, representatives from countries across the world gathered to discuss the fate of the Kyoto Protocol, which seeks to minimize greenhouse gas emissions. The summit yielded results with decisions made (1) to extend the Kyoto Protocol until 2020, and (2) for wealthier countries to compensate poorer countries for the losses and damage incurred as a result of climate change.

There was, in fact, little progress made on the central issue of reducing greenhouse gas emissions. Had those emissions been reduced, there would have been less of a need to financially deal with

the devastation caused by climate change. One interpretation was that the global community was accepting the fact that industrialization was contributing to global warming, which had deleterious effects on the polar ice caps and concomitantly on the rise of sea level, with devastating effects for small island nations. Thus, wealthier countries were willing to pay around \$10 billion a year through 2020, effectively in "damages," to the poor countries that could be viewed as the "collateral damage" of industrial progress. But damages today could potentially be destruction tomorrow, leaving in place the existential challenges and burdens to be born by some of the world's smallest and least wealthy island countries.

Perhaps not surprisingly, the representative for the small island nation states at the Doha summit responded with ire, characterizing the lack of progress on reducing emissions as follows: "We see the package before us as deeply deficient in mitigation (carbon cuts) and finance. It's likely to lock us on the trajectory to a 3,4,5C rise in global temperatures, even though we agreed to keep the global average temperature rise of 1.5C to ensure survival of all islands. There is no new finance (for adapting to climate change and getting clean energy) -- only promises that something might materialize in the future. Those who are obstructive need to talk not about how their people will live, but whether our people will live."

Indeed, in most small island countries not just in the Pacific, but also the Caribbean and Indian Ocean, ecological concerns and the climate crisis have been dominant themes with dire life and death consequences looming in the background for their people. Small island nations in these region are already at risk from the rise of sea-level, tropical cyclones, floods. But their very livelihoods of fishing and subsistence farming are also at risk as a result of ecological and environmental changes. Of particular concern is the matter of ocean acidification, which destroys reefs and decimates fish and shellfish populations that provide protein for inhabitants. At the same time, increasingly high storm surges can wipe out coastlines, and even entire villages, while contaminating water supplies. Accordingly, the very existence of islands are at severe risk of being obliterated from the map. Yet even with the existential threat of being wiped off the map in the offing, the international community has been either slow or restrictive in its efforts to deal with global warming, climate change, economic and ecological damage, as well as the emerging global challenge of environmental refugees.

A 2012 report from the United Nations Environment Program (UNEP) and the Pacific Regional Environment Program underlined the concerns of small island nations and their people as it concluded that the livelihoods of approximately 10 million people in Pacific island communities were increasingly vulnerable to climate change. In fact, low-lying islands in that region would likely confront losses of up to 18 percent of gross domestic product due to climate change, according to the report. The report covers 21 countries and territories, including [Fiji](#), [Kiribati](#), [Samoa](#) and [Tonga](#), and recommended environmental legislation intended to deal with the climate crisis facing the small island countries particularly. As noted by David Sheppard, the director general of the Pacific Regional Environment Program that co-sponsored this study: "The findings...

emphasize the need more than ever to raise the bar through collective actions that address the region's environmental needs at all levels."

For more information on the threats faced in small island nations by climate change and the measures being undertaken to lobby for international action, please see the Alliance for Small Island States available online at the URL: <http://aosis.org/>

Special Report

COP 21 summit in Paris ends with historic agreement to tackle climate change; rare international consensus formed on environmental crisis facing the planet --

In mid-December 2015, the highly-anticipated United Nations climate conference of parties (COP) in Paris, [France](#), ended with a historic agreement. In fact, it would very likely be understood as the most significant international agreement signed by all the recognized countries of the world since the Cold War. Accordingly, the Paris Agreement was being distinguished as the first multilateral pact that would compel all countries across the world to cut its carbon emissions -- one of the major causes of increasing greenhouse gas emissions, which contribute to global warming, and its deleterious effects ranging from the dangerous rise in sea level to catastrophic climate change.

The accord, which was dubbed to be the "Paris Agreement," was the work of rigorous diplomacy and fervent environmental advocacy, and it aimed to address the climate change crisis facing the planet. As many as 195 countries were represented in the negotiations that led to the landmark climate deal. Indeed, it was only after weeks of passionate debate that international concurrence was reached in addressing the environmental challenges confronting the world, with particular attention to moving beyond fossil fuels and reducing greenhouse gas emissions.

The success of the COP 21 summit in Paris and the emergence of the landmark Paris Agreement was, to some extent, attributed to the efforts of France's Foreign Minister Laurent Fabius who presided over the negotiations. The French foreign minister's experience and credentials as a seasoned diplomat and respected statesman paid dividends. He skillfully guided the delegates from almost 200 countries and interest groups along the negotiations process, with ostensibly productive results and a reasonably robust deal to show for it.

On Dec. 12, 2015, French Foreign Minister Fabius officially adopted the agreement, declaring: "I now invite the COP to adopt the decision entitled Paris Agreement outlined in the document. Looking out to the room I see that the reaction is positive, I see no objections. The Paris agreement is adopted." Once Foreign Minister Fabius' gavel was struck, symbolically inaugurating the Paris Agreement into force, the COP delegate rushed to their feet with loud and bouyant cheers

as well as thunderous applause.

In general, the Paris Agreement was being hailed as a victory for environmental activists and a triumph for international diplomats, while at the same time being understood as simply an initial -- and imperfect -- move in the direction of a sustainable future. China's chief negotiator, Xie Zhenhua, issued this message, saying that while the accord was not ideal, it should "not prevent us from marching historical steps forward."

United States President Barack Obama lauded the deal as both "ambitious" and "historic," and the work of strenuous multilateral negotiations as he declared, "Together, we've shown what's possible when the world stands as one." The [United States](#) leader acknowledged that the accord was not "perfect," but he reminded the critics that it was "the best chance to save the one planet we have. "

Former [United States](#) Vice President Al Gore, one of the world's most well known environmental advocates, issued a lengthy statement on the accomplishments enshrined in the Paris Agreement. He highlighted the fact that the Paris Agreement was a first step towards a future with a reduced carbon footprint on Planet Earth as he said, "The components of this agreement -- including a strong review mechanism to enhance existing commitments and a long-term goal to eliminate global-warming pollution this century -- are essential to unlocking the necessary investments in our future. No agreement is perfect, and this one must be strengthened over time, but groups across every sector of society will now begin to reduce dangerous carbon pollution through the framework of this agreement."

The central provisions of the Paris Agreement included the following items:

- Greenhouse gas emissions should peak as quickly as possible, with a move towards balancing energy sources, and ultimately the decrease of greenhouse gases in the second half of this century
- Global temperature increase would be limited to 1.5 degrees Centigrade above pre-industrial levels and would be held "well below" the two degrees Centigrade threshold
- Progress on these goals would be reviewed every five years beginning in 2020 with new greenhouse gas reduction targets issued every five years
- \$100 billion would be expended each year in climate finance for developing countries to move forward with green technologies, with further climate financing to be advanced in the years beyond

It should be noted that there both legally binding and voluntary elements contained within the Paris Agreement. Specifically, the submission of an emissions reduction target and the regular review of that goal would be legally mandatory for all countries. Stated differently, there would be a system in place by which experts would be able to track the carbon-cutting progress of each country. At the same time, the specific targets to be set by countries would be determined at the discretion of the countries, and would not be binding. While there was some criticism over this non-binding element, the fact of the matter was that the imposition of emissions targets was

believed to be a major factor in the failure of climate change talks in Copenhagen, [Denmark](#), in 2009.

In 2015, the talks faced challenges as several countries, such as [China](#) and [India](#), objected to conditions that would stymie economic and development. In order to avoid that kind of landmine, a system Intended Nationally Determined Contributions (INDCs) was developed and formed the basis of the accord. As such, the Paris Agreement would, in fact, facilitate economic growth and development, as well as technological progress, but with the goal of long-term ecological sustainability based on low carbon sources. In fact, the agreement heralded as "the beginning of the end of the fossil fuel era." As noted by Nick Mabey, the head of the climate diplomacy organization E3G, said, "Paris means governments will go further and faster to tackle climate change than ever before. The transition to a low carbon economy is now unstoppable, ensuring the end of the fossil fuel age."

A particular sticking point in the agreement was the \$100 billion earmarked for climate financing for developing countries to transition from traditional fossil fuels to green energy technologies and a low carbon future. In 2014, a report by the International Energy Agency indicated that the cost of that transition would actually be around \$44 trillion by the mid-century -- an amount that would render the \$100 billion being promised to be a drop in the proverbial bucket. However, the general expectation was that the Republican-controlled Senate in the [United States](#), which would have to ratify the deal in that country, was not interested in contributing significant funds for the cause of climate change.

A key strength of the Paris Agreement was the ubiquitous application of measures to all countries. Of note was the frequently utilized concept of "flexibility" with regard to the Paris Agreement. Specifically, the varying capacities of the various countries in meeting their obligations would be anticipated and accorded flexibility. This aspect presented something of a departure from the 1997 Kyoto Protocol, which drew a sharp distinction between developed and developing countries, and mandated a different set of obligations for those categories of countries. Thus, under Kyoto, [China](#) and [India](#) were not held to the same standards as the [United States](#) and European countries. In the Paris Agreement, there would be commitments from all countries across the globe.

Another notable strength of the Paris Agreement was the fact that the countries of the world were finally able to reach consensus on the vital necessity to limit global temperature increases to 1.5 degrees Centigrade. Ahead of the global consensus on the deal, and as controversy continued to surface over the targeted global temperature limits, the leaders of island countries were sounding the alarm about the melting of the Polar ice caps and the associated rise in seal level. Prime Minister Enele Sopoaga of [Tuvalu](#) issued this dismal reminder: "Tuvalu's future ... is already bleak and any further temperature increase will spell the total demise of [Tuvalu](#). No leader in this room carries such a level of worry and responsibility. Just imagine you are in my shoes, what

would you do?" It was thus something of a victory for environmental advocates that the countries of the world could find consensus on the lower number -- 1.5 degrees rather than 2 degrees.

A significant weak point with regard to the Paris deal was a "loss and damage" provision, which anticipates that even with all the new undertakings intended to reduce greenhouse gas emissions and move to a low carbon future, there would nonetheless be unavoidable climate change consequences. Those consequences ranged from the loss of arable land for farmers as well as soil erosion and contamination of potable water by sea water, to the decimation of territory in coastal zones and on small islands, due to the rise in sea level, with entire small island countries being rendered entirely uninhabitable. The reality was that peoples' homes across the world would be destroyed along with their way of life.

With that latter catastrophic effect being a clear and present danger for small island countries, the Association of Small Island States (AOSIS) demanded that the developed world acknowledge its responsibility for this irreversible damage.. Despite the fact that greenhouse gas emissions and the ensuing plague of global warming was, indeed, the consequence of development in the West (the [United States](#) and Europe) and the large power house countries, such as [Russia](#), [China](#) and [India](#), there was no appetite by those countries to sign on to unlimited liability. Under the Paris Agreement, there was a call for research on insurance mechanisms that would address loss and damage issues, with recommendations to come in the future.

The call for research was being regarded as an evasion of sorts and constituted the weakest aspect of the Paris Agreement. Not surprisingly, a coalition of small island nations demanded a "Marshall Plan" for the Pacific. Borrowing the term "Marshall Plan" from the post-World War II reconstruction effort, the coalition of Pacific island nation, which included [Kiribati](#), [Tuvalu](#), [Fiji](#), and the [Marshall Islands](#), called for an initiative that would include investment in renewable energy and shoreline protection, cultural preservation, economic assistance for economies in transition, and a plan for migration and resettlement for these countries as they confront the catastrophic effects of the melting of the Polar ice caps and the concomitant rise in sea level. The precise contours of the initiative remained unknown, unspecified, and a mere exercise in theory at the time of writing. Yet such an initiative would, at some point, have to be addressed, given the realities of climate change and the slow motion calamity unfolding each day for low-lying island nations across the world.

As noted by Vice President Greg Stone of Conservation International, who also functions as an adviser to the government of [Kiribati](#), "Imagine living in a place where you know it's going to go away someday, but you don't know what day that wave's going to come over and wash your home away." He added, "It's a disaster we know is going to happen." Meanwhile, the intervening years promised to be filled with hardship for small island nations, such as [Kiribati](#). Stone explained, "For every inch of sea-level rise, these islands lose 10 feet of their freshwater table to saltwater intrusion," Stone explained. "So it's not just about the day the water finally goes

over the island; it's also about the day that there's just not enough water left and everyone has to move off the island." Presaging the future for island nations that could face submersion, Stone said, "If you look ahead 50 years, a country like [Kiribati](#) could become the first aqueous nation. possibility of migration. That is, they own this big patch of ocean, and they administer it from elsewhere."

Foreign Minister Minister Tony Debrum of the [Marshall Islands](#) emerged as the champion advocating on behalf of small island nation states and a loose coalition of concerned countries from the Pacific to the Caribbean, but with support from the [United States](#). He addressed the comprehensive concerns of small island nations regarding the weaknesses of the deal, while simultaneously making clear that the Paris Agreement signified hope for the countries most at risk. In a formal statement, Debrum declared: "We have made history today. Emissions targets are still way off track, but this agreement has the tools to ramp up ambition, and brings a spirit of hope that we can rise to this challenge. I can go back home to my people and say we now have a pathway to survival." Debrum highlighted the imperatives of Pacific island nations, saying, "Our High Ambition Coalition was the lightning rod we needed to lift our sights and expectations for a strong agreement here in Paris. We were joined by countries representing more than half the world. We said loud and clear that a bare-bones, minimalist agreement would not fly. We instead demanded an agreement to mark a turning point in history, and the beginning of our journey to the post-carbon era."

Debrum of the [Marshall Islands](#) espoused the quintessential synopsis of the accord and its effects for those most likely to be affected by climate change as he noted, "Climate change won't stop overnight, and my country is not out of the firing line just yet, but today we all feel a little safer."

Editor's Comment:

The low-lying Pacific island nations of the world, including [Kiribati](#), [Tuvalu](#), the [Marshall Islands](#), [Fiji](#), among others, are vulnerable to the threats posed by global warming and climate change, derived from carbon emissions, and resulting in the rise in sea level. Other island nations in the Caribbean, as well as poor countries with coastal zones, were also at particular risk of suffering the deleterious effects of climate change.

Political policy in these countries are often connected to ecological issues, which have over time morphed into an existential crisis of sorts. Indeed, ecological concerns and the climate crisis have also been dominant themes with life and death consequences for the people of island nations in the Pacific. Indeed, the very livelihoods of fishing and subsistence farming remain at risk as a result of ecological and environmental changes. Yet even so, these countries are threatened by increasingly high storm surges, which could wipe out entire villages and contaminate water supplies. Moreover, because these are low lying island nations, the sustained rise in sea level can potentially lead to the terrain of these countries being uninhabitable at best, and submerged at worst. Stated in plain terms,

these countries are at severe risk of being obliterated from the map and their plight illuminates the emerging global challenge of environmental refugees. In these manifold senses, climate change is the existential crisis of the contemporary era.

Since the time of the 1997 Kyoto Protocol, there have been efforts aimed at extending the life of that agreement, with an eye on minimizing greenhouse gas emissions, and thus minimizing the effects of climate change. Those endeavors have largely ended in failure, as exemplified by the unsuccessful Copenhagen talks in 2009 and the fruitless Doha talks in 2012 respectively. The success of the COP 21 talks in [France](#), with the adoption of the landmark Paris Agreement in 2015, was regarded as the first glimmer of hope. Not only did the Paris Agreement signify the triumph of international diplomacy and global consensus, but it also marked the start of the end of the fossil fuel era, with the path forward toward a low carbon future reliant on greener technologies. Most crucially, the Paris Agreement stood as the first significant response in recent times to the central challenge of climate change and its quotidian effects on the lives of real human beings across the world.

Editor's Note on Kiribati:

Kiribati, once known as the Gilbert Islands, is made up of 33 coral atolls and sits amidst two million square miles of Pacific Ocean. With its highest point only six feet above sea level, [Kiribati](#) has been particularly vulnerable to the rise of sea level as a result of global climate change. In [Kiribati](#), ecological concerns and the climate crisis have also been dominant themes with life and death consequences for the people of [Kiribati](#). Indeed, their very livelihoods of fishing and subsistence farming remain at risk as a result of ecological and environmental changes. Yet even so, [Kiribati](#) is threatened by increasingly high storm surges, which could wipe out entire villages and contaminate water supplies. Accordingly, Kiribati's very existence is thus at severe risk of being obliterated from the map. Not surprisingly, policies in [Kiribati](#) have centered on emergency planning for worst case scenarios in this vulnerable country. Yet with the existential threat of being wiped off the map in the offing, Kiribati's government has concluded that the people will have to choose but to leave the islands and it has called on the international community to assist in this regard. This call has come after years of attempting to draw international attention to the plight of global climate change and its dire consequences for small island states. The case of [Kiribati](#) illuminates the emerging global challenge of environmental refugees.

Political Risk Index

Political Risk Index

The **Political Risk Index** is a proprietary index measuring the level of risk posed to governments, corporations, and investors, based on a myriad of political and economic factors. The [Political Risk Index](#) is calculated using an established methodology by CountryWatch's Editor-in-Chief and is based on varied criteria* including the following consideration: political stability, political representation, democratic accountability, freedom of expression, security and crime, risk of conflict, human development, jurisprudence and regulatory transparency, economic risk, foreign investment considerations, possibility of sovereign default, and corruption. Scores are assigned from 0-10 using the aforementioned criteria. A score of 0 marks the highest political risk, while a score of 10 marks the lowest political risk. Stated differently, countries with the lowest scores pose the greatest political risk. A score of 0 marks the most dire level of political risk and an ultimate nadir, while a score of 10 marks the lowest possible level of political risk, according to this proprietary index. Rarely will there be scores of 0 or 10 due to the reality that countries contain complex landscapes; as such, the index offers a range of possibilities ranging from lesser to greater risk.

***Methodology**

The [Political Risk Index](#) is calculated by CountryWatch's Editor-in-Chief and is based on the combined scoring of varied criteria as follows --

1. political stability (record of peaceful transitions of power, ability of government to stay in office and carry out policies as a result of productive executive-legislative relationship, perhaps with popular support vis a vis risk of government collapse)
2. political representation (right of suffrage, free and fair elections, multi-party participation, and

influence of foreign powers)

3. democratic accountability (record of respect for political rights, human rights, and civil liberties, backed by constitutional protections)

4. freedom of expression (media freedom and freedom of expression, right to dissent or express political opposition, backed by constitutional protections)

5. security and crime (the degree to which a country has security mechanisms that ensures safety of citizens and ensures law and order, without resorting to extra-judicial measures)

6. risk of conflict (the presence of conflict; record of coups or civil disturbances; threat of war; threats posed by internal or external tensions; threat or record of terrorism or insurgencies)

7. human development (quality of life; access to education; socio-economic conditions; systemic concern for the status of women and children)

8. jurisprudence and regulatory transparency (the impartiality of the legal system, the degree of transparency within the regulatory system of a country and the durability of that structure)

9. economic conditions (economic stability, investment climate, degree of nationalization of industries, property rights, labor force development)

10. corruption (the degree of corruption in a country and/or efforts by the government to address graft and other irregularities)

Editor's Note:

As of 2015, the current climate of upheaval internationally -- both politically and economically -- has affected the ratings for several countries across the world.

North Korea, [Afghanistan](#), [Somalia](#), and [Zimbabwe](#) -- retain their low rankings.

Several Middle Eastern and North African countries, such as [Tunisia](#), [Egypt](#), [Libya](#), [Syria](#), [Iraq](#) and [Yemen](#) were downgraded in recent years due to political instability occurring in the "season of unrest" sweeping the region since 2011 and continuing today. The worst downgrades affected [Syria](#) where civil war is at play, along with the rampage of terror being carried out by Islamist terrorists who have also seized control over part of Syrian territory. [Iraq](#) has been further downgraded due to the rampage of Islamist terrorists and their takeover of wide swaths of Iraqi territory. [Libya](#) has also been downgraded further due to its slippage into failed state status; at

issue in [Libya](#) have been an ongoing power struggle between rival militias. [Yemen](#) continues to hold steady with a poor ranking due to continued unrest at the hands of Houthi rebels, secessionists, al-Qaida in the Arabian Peninsula, and Islamic State. Its landscape has been further complicated by the fact that it is now the site of a proxy war between [Iran](#) and [Saudi Arabia](#). Conversely, [Tunisia](#) and [Egypt](#) have seen slight upgrades as these countries stabilize.

In Africa, [Zimbabwe](#) continues to be one of the bleak spots of the world with the Mugabe regime effectively destroying the country's once vibrant economy, and miring [Zimbabwe](#) with an exceedingly high rate of inflation, debilitating unemployment, devolving public services, and critical food shortages; rampant crime and political oppression round out the landscape. [Somalia](#) also sports a poor ranking due to the continuing influence of the terror group, al-Shabab, which was not operating across the border in [Kenya](#). On the upside, [Nigeria](#), which was ineffectively dealing with the threat posed by the terror group, Boko Haram, was making some strides on the national security front with its new president at the helm. [Mali](#) was slightly upgraded due to its efforts to return to constitutional order following the 2012 coup and to neutralize the threat of separatists and Islamists. But the [Central African Republic](#) was downgraded due to the takeover of the government by Muslim Seleka rebels and a continued state of lawlessness in that country. [South Sudan](#) -- the world's newest nation state -- has not been officially included in this assessment; however, it can be unofficially assessed to be in the vicinity of "3" due to its manifold political and economic challenges. [Burkina Faso](#), [Burundi](#) and [Guinea](#) have been downgraded due to political unrest, with [Guinea](#) also having to deal with the burgeoning Ebola crisis.

In Europe, [Ukraine](#) was downgraded due to the unrest facing that country following its Maidan revolution that triggered a pro-Russian uprising in the eastern part of the country. [Russia](#) was also implicated in the Ukrainian crisis due to its intervention on behalf of pro-Russian separatists, as well as its annexation of the Ukrainian territory of Crimea. Strains on the infrastructure of southern and eastern European countries, such as [Serbia](#), [Croatia](#), and [Hungary](#), due to an influx of refugees was expected to pose social and economic challenges, and slight downgrades were made accordingly. So too, a corruption crisis for the Romanian prime minister has affected the ranking of that country. Meanwhile, the rankings for [Spain](#), [Portugal](#), [Ireland](#), and [Italy](#) were maintained due to debt woes and the concomitant effect on the euro zone. [Greece](#), another euro zone nation, was earlier downgraded due to its sovereign debt crisis; however, no further downgrade was added since the country was able to successfully forge a bailout rescue deal with creditor institutions. Cyprus' exposure to Greek banks yielded a downgrade in its case.

In Asia, [Nepal](#) was downgraded in response to continuous political instability and a constitutional crisis that prevails well after landmark elections were held. Both [India](#) and [China](#) retain their rankings; [India](#) holds a slightly higher ranking than [China](#) due to its record of democratic representation and accountability. Increasing violence and political instability in [Pakistan](#) resulted in a downgrade for this country's already low rating. Meanwhile, [Singapore](#) retained its strong rankings due to its continued effective stewardship of the economy and political stability.

In the Americas, ongoing political and economic woes, as well as crime and corruption have affected the rankings for [Mexico](#) , [Guatemala](#), and [Brazil](#). [Argentina](#) was downgraded due to its default on debt following the failure of talks with bond holders. [Venezuela](#) was downgraded due to its mix of market unfriendly policies and political oppression. For the moment, the [United States](#) maintains a strong ranking along with [Canada](#), and most of the English-speaking countries of the Caribbean; however, a renewed debt ceiling crisis could cause the [United States](#) to be downgraded in a future edition. Finally, a small but significant upgrade was attributed to [Cuba](#) due to its recent pro-business reforms and its normalization of ties with the United States.

Political Stability

Political Stability

The **Political Stability Index** is a proprietary index measuring a country's level of stability, standard of good governance, record of constitutional order, respect for human rights, and overall strength of democracy. The [Political Stability](#) Index is calculated using an established methodology* by CountryWatch's Editor-in-Chief and is based on a given country's record of peaceful transitions of power, ability of a government to stay in office and carry out its policies vis a vis risk credible risks of government collapse. Threats include coups, domestic violence and instability, terrorism, etc. This index measures the dynamic between the quality of a country's government and the threats that can compromise and undermine stability. Scores are assigned from 0-10 using the aforementioned criteria. A score of 0 marks the lowest level of political stability and an ultimate nadir, while a score of 10 marks the highest level of political stability possible, according to this proprietary index. Rarely will there be scores of 0 or 10 due to the reality that countries contain complex landscapes; as such, the index offers a range of possibilities ranging from lesser to greater stability.

*Methodology

The Political Stability Index is calculated by CountryWatch's Editor-in-Chief and is based on the combined scoring of varied criteria as follows --

1. record of peaceful transitions of power (free and fair elections; adherence to political accords)
2. record of democratic representation, presence of instruments of democracy; systemic accountability
3. respect for human rights; respect for civil rights
4. strength of the system of jurisprudence, adherence to constitutional order, and good governance
5. ability of a government to stay in office and carry out its policies vis a vis risk credible risks of government collapse (i.e. government stability versus a country being deemed "ungovernable")
6. threat of coups, insurgencies, and insurrection
7. level of unchecked crime and corruption
8. risk of terrorism and other threats to national security
9. relationship with regional powers and international community; record of bilateral or multilateral cooperation
10. degree of economic strife (i.e. economic and financial challenges)

Editor's Note:

As of 2015, the current climate of upheaval internationally -- both politically and economically -- has affected the ratings for several countries across the world. The usual suspects -- North Korea, [Afghanistan](#), and [Somalia](#) -- retain their low rankings. The reclusive and ultra-dictatorial North Korean regime, which has terrified the world with its nuclear threats, has exhibited internal instability. Of note was a cut-throat purge of hundreds of high ranking officials deemed to be a threat to Kim Jung-un. Despite their attempts to recover from years of lawlessness, war, and warlordism, both [Afghanistan](#) and [Somalia](#) continue to be beset by terrorism and turmoil. In [Afghanistan](#), while international forces have seen success in the effort against the terror group, al-

Qaida, the other Islamist extremist group, the Taliban, continues to carry out a vicious insurgency using terrorism. In [Somalia](#), while the government attempts to do the nation's business, the terror group, al-Shabab continues to make its presence known not only in [Somalia](#), but across the border into [Kenya](#) with devastating results/ Also in this category is [Iraq](#), which continues to be rocked by horrific violence and terrorism at the hands of Islamic State, which has taken over wide swaths of Iraqi territory.

Syria, [Libya](#), and [Yemen](#) have been added to this unfortunate echelon of the world's most politically unstable countries. [Syria](#) has been mired by the twin hazards of 1. a civil war as rebels oppose the Assad regime; and 2. the rampage of terror being carried out by Islamic State, which also seized control over vast portions of Syrian territory. Meanwhile, the post-Qaddafi landscape of [Libya](#) has devolved into chaos as rival militias battle for control -- the elected government of the country notwithstanding. Rounding out this grim triad is [Yemen](#), which was dealing with a Houthi rebellion, secessionists in the south, as well as the threat of terrorism from al-Qaida in the Arabian Peninsula as well as Islamic State, while also being the site of a proxy war between Shi'a [Iran](#) and Sunni [Saudi Arabia](#).

Meanwhile, several Middle Eastern and North African countries, such as [Tunisia](#), [Egypt](#), and [Bahrain](#) were downgraded in recent years due to political instability occurring in the "season of unrest" sweeping the region since 2011 and continuing today. All three of these countries have stabilized in recent years and have been upgraded accordingly. In [Bahrain](#), the landscape had calmed. In [Egypt](#), the secular military-backed government has generated criticism for its crackdown on the Muslim Brotherhood; however, the country had ratified the presidency via democratic elections and were on track to hold parliamentary elections as the country moved along the path of democratization. Perhaps the most impressive story was coming out of [Tunisia](#) -- the country whose Jasmine Revolution sparked the entire Arab Spring -- and where after a few years of strife, a new progressive constitution was passed into law and a secular government had been elected to power. [Tunisia](#), [Egypt](#), and [Bahrain](#) have seen slight upgrades as these countries stabilize.

In Africa, the [Central African Republic](#) was downgraded the previous year due to the takeover of the government by Muslim Seleka rebels. Although the country has been trying to emerge from this crisis, the fact of the matter was that it was difficult to halt the precipitous decline into lawlessness in that country. [Zimbabwe](#) has maintained its consistently poor ranking due to the dictatorial regime of Mugabe, who continues to hold a tight grip on power, intimidates the opposition, squashes dissent, and oppresses the white farmer population of the country. Moving in a slightly improved direction is [Nigeria](#), which has sported abysmal ratings due to the government's fecklessness in dealing with the threat posed by the Islamist terror group, Boko Haram. Under its newly-elected government, there appears to be more of a concerted effort to make national security a priority action item. [Mali](#) was also slightly upgraded due to its efforts to return to constitutional order following the 2012 coup and to neutralize the threat of separatists and

Islamists. Political instability has visited [Burkina Faso](#) and [Burundi](#) as the leaders of those countries attempted to side-step constitutional limits to hold onto power. In [Burundi](#), an attempted coup ensued but quelled, and the president won a (questionable) new term in office; unrest has since punctuated the landscape. In [Burkina Faso](#), the political climate has turned stormy as a result of a successful coup that ended the rule of the president, and then a putsch against the transitional government. These two African countries have been downgraded as a result.

It should be noted that the African country of South [Sudan](#) -- the world's newest nation state -- has not been officially included in this assessment; however, it can be unofficially assessed to be in the vicinity of "3" due to its manifold political and economic challenges. [Guinea](#) has endured poor rankings throughout, but was slightly downgraded further over fears of social unrest and the Ebola health crisis.

In Europe, [Ukraine](#) was downgraded due to the unrest facing that country following its Maidan revolution that triggered a pro-Russian uprising in the eastern part of the country. [Russia](#) was also implicated in the Ukrainian crisis due to its intervention on behalf of pro-Russian separatists, as well as its annexation of the Ukrainian territory of Crimea. [Serbia](#) and [Albania](#) were slightly downgraded due to eruptions of unrest, while [Romania](#) was slightly downgraded on the basis of corruption charges against the prime minister. [Spain](#), [Portugal](#), [Ireland](#), and [Italy](#) were downgraded due to debt woes and the concomitant effect on the euro zone. [Greece](#), another euro zone nation, was downgraded the previous year due to its sovereign debt crisis; however, the country successfully forged a rescue deal with international creditors and stayed within the Euro zone. Greek voters rewarded the hitherto unknown upstart party at the polls for these efforts. As a result, [Greece](#) was actually upgraded slightly as it proved to the world that it could endure the political and economic storms. Meanwhile, [Germany](#), [France](#), [Switzerland](#), the [United Kingdom](#), the [Netherlands](#), and the Scandinavian countries continue to post impressive ranking consistent with these countries' strong records of democracy, freedom, and peaceful transfers of power.

In Asia, [Nepal](#) was downgraded in response to continuous political instability well after landmark elections that prevails today. [Cambodia](#) was very slightly downgraded due to post-election instability that has resulted in occasional flares of violence. Despite the "trifecta of tragedy" in [Japan](#) in 2011 -- the earthquake, the ensuing tsunami, and the resulting nuclear crisis -- and the appreciable destabilization of the economic and political terrain therein, this country has only slightly been downgraded. Japan's challenges have been assessed to be transient, the government remains accountable, and there is little risk of default. Both [India](#) and China retain their rankings; [India](#) holds a slightly higher ranking than [China](#) due to its record of democratic representation and accountability. Increasing violence and political instability in [Pakistan](#) resulted in a downgrade for this country's already low rating.

In the Americas, [Haiti](#) retained its downgraded status due to ongoing political and economic woes. [Mexico](#) was downgraded due to its alarming rate of crime. [Guatemala](#) was downgraded due to

charges of corruption, the arrest of the president, and uncertainty over the outcome of elections. [Brazil](#) was downgraded due to the corruption charges erupting on the political landscape, the stalling of the economy, and the increasingly loud calls for the impeachment of President Rousseff. [Argentina](#) was downgraded due to its default on debt following the failure of talks with bond holders. [Venezuela](#) was downgraded due to the fact that the country's post-Chavez government is every bit as autocratic and nationalistic, but even more inclined to oppress its political opponents. [Colombia](#) was upgraded slightly due to efforts aimed at securing a peace deal with the FARC insurgents. A small but significant upgrade was attributed to [Cuba](#) due to its recent pro-business reforms and its normalization of ties with the United States. Meanwhile, the [United States](#), [Canada](#), [Costa Rica](#), [Panama](#), and most of the English-speaking countries of the Caribbean retain their strong rankings due to their records of stability and peaceful transfers of power.

In the Pacific, [Fiji](#) was upgraded due to its return to constitutional order and democracy with the holding of the first elections in eight years.

In Oceania, [Maldives](#) has been slightly downgraded due to the government's continued and rather relentless persecution of the country's former pro-democracy leader - former President Nasheed.

Freedom Rankings

Freedom Rankings

Freedom in the World

Editor's Note: This ranking by Freedom House quantifies political freedom and civil liberties into a single combined index on each sovereign country's level of freedom and liberty. The initials "PR" and "CL" stand for Political Rights and Civil Liberties, respectively. The number 1 represents the most free countries and the number 7 represents the least free. Several countries fall in the continuum in between. The freedom ratings reflect an overall judgment based on survey results.

Methodology:

PR and CL stand for political rights and civil liberties, respectively; 1 represents the most free and 7 the least free rating. The ratings reflect an overall judgment based on survey results.

? ? up or down indicates a change in political rights, civil liberties, or status since the last survey.

↑ ↓ up or down indicates a trend of positive or negative changes that took place but that were not sufficient to result in a change in political rights or civil liberties ratings of 1-7.

* indicates a country's status as an electoral democracy.

Human Rights

Overview of Human Rights in Kiribati

Kiribati is a constitutional multiparty republic. The government of Kiribati works to respect the civil and human rights of its citizens. There are only a few areas in which problems remain, but the law provides effective means of addressing individual complaints. Some limits on the freedoms of press and speech, and a few incidences of extrajudicial communal justice have been reported. Overall, Kiribati has one of the more positive records of human rights in the world.

*Human Development Index (HDI) is a composite index that measures the level of well-being in 177 nations in the world. It uses factors such as poverty, literacy, life-expectancy, education, gross domestic product, and purchasing power parity to assess the average achievements in each nation. It has been used in the United Nation’s Human Development Report since 1993.

*Human Poverty Index Ranking is based on certain indicators used to calculate the Human Poverty Index. Probability at birth of not surviving to age 40, adult literacy rate, population without sustainable access to an improved water source, and population below income poverty line are the indicators assessed in this measure.

*The Gini Index measures inequality based on the distribution of family income or consumption. A value of 0 represents perfect equality (income being distributed equally), and a value of 100 perfect inequality (income all going to one individual).

*The calculation of the total crime rate is the % of the total population which has been effected by property crime, robbery, sexual assault, assault, or bribery (corruption) related occurrences.

Government Functions

Constitution

The Kiribati Constitution, promulgated July 12, 1979, provides for free and open elections.

Executive Authority

The executive branch consists of a president, a vice president and a cabinet. Under the constitution, the president, nominated from among the elected legislators, is limited to three four-year terms. The cabinet is composed of the president, vice president, and approximately 10 ministers (appointed by the president) who are members of the House of Assembly.

Legislative Authority

The legislative branch is the unicameral "Maneaba Ni Maungatabu" (House of Assembly). It has elected members, including by constitutional mandate a representative of the Banaban people (Ocean Islanders), in addition to the attorney general, who serves as an ex-officio member. Legislators serve for a four-year term.

Judiciary

The constitutional provisions governing administration of justice are similar to those in other former British possessions in that the judiciary is free from governmental interference. The judicial branch is made up of the High Court and the Court of Appeal. The president appoints the presiding judges.

Administration

Local government is through island councils with elected members. Local affairs are handled in a manner similar to town meetings in colonial America. Island councils make their own estimates of revenue and expenditure and are generally free from central government controls.

Party Politics

Traditionally, Kiribati has not had formal political parties. Instead, ad hoc opposition groups tended to coalesce around specific issues. Today, the only recognizable parties are the Maneabaan te Mauri Party (MTM), the Boutokanto Koaua Party (BKP) and the National Progressive Party. There is universal suffrage at age 18.

Government Structure

Names:

conventional long form:

Republic of Kiribati

conventional short form:

local long form:

Republic of Kiribati

local short form:

Kiribati

note:

Kiribati pronounced "kiribas"

former:

Gilbert Islands

Type:

Republic

Executive Branch:

Outgoing chief of state and head of government:

President President Anote TONG (since July 2003); was elected by popular vote; most recent election in 2012; next to be held in 2016; the 2016 polls would not be contested by President Tong; see Elections Primer below

Note:

The House of Parliament chooses the presidential candidates from among their members and then those candidates compete in a general election; president is elected by popular vote for a four-year term; president is both head of government and head of state

Cabinet:

10-12 member Cabinet appointed by the president from among the members of the House of Parliament

Primer on 2016 presidential election in Kiribati

March 9, 2016

A presidential election was set to take place in Kiribati in March 2016. The presidential vote would occur in the aftermath of parliamentary elections, which were to be held in Kiribati in two rounds in December 2015 and January 2016. With the parliamentary vote completed, the new composition of the incoming parliament, which would first sit in session in February 2016, would determine the winner of the presidential contest. Typically, the presidency is determined on the basis of the parliamentary election results. The president is elected to serve four-year terms. The incumbent president was Anote Tong who served as the head of state since 2003 and was elected most recently during elections of 2012. In 2016, President Tong, who was stepping away from the political field, was not going to be a presidential contender. Instead, the three main contenders for the presidency would be Rimeta Beniamina and Tianeti Ioane of the Boutokaan Te Koaua party, which has controlled politics in Kiribati for some time, as well as Taaneti Mamau, the representative of an opposition coalition.

Legislative Branch:

Unicameral House of Parliament or "Maneaba Ni Maungatabu":

46 seats; 44 members elected by popular vote, 1 ex officio member - the attorney general, 1 nominated by the Rabi Council of Leaders (representing Banaba Island); to serve four-year terms

Primer on parliamentary elections in Kiribati

(Dec. 30, 2015 -- first round; Jan. 7, 2016 -- second round)

A parliamentary election was held in Kiribati in late 2015. A first round of voting was held on Dec. 30, 2015, with a second round following on Jan. 7, 2016 for contests where a given candidate failed to secure an outright majority. At stake were the seats in the unicameral House of Parliament or "Maneaba Ni Maungatabu" composed of 46 seats. In that legislative body, 44 members are elected by popular vote, there is one ex officio member -- the attorney general, and one member is nominated by the Rabi Council of Leaders (representing Banaba Island), to serve four-year terms.

Judicial Branch:

Court of Appeal; High Court; 26 Magistrates' courts; judges at all levels are appointed by the president

Legal System:

British and customary law

Constitution:

Promulgated July 12, 1979

Administrative Divisions:

Three units:

Gilbert Islands, Line Islands, Phoenix Islands

In addition, there are six districts:

Banaba, Central Gilberts, Line Islands, Northern Gilberts, Southern Gilberts, Tarawa) and 21 island councils - one for each of the inhabited islands (Abaiang, Abemama, Aranuka, Arorae, Banaba, Beru, Butaritari, Kanton, Kiritimati, Kuria, Maiana, Makin, Marakei, Nikunau, Nonouti, Onotoa, Tabiteuea, Tabuaeran, Tamana, Tarawa, Teraina

Political Parties and Leaders:

Boutokaan Te Koaua Party or BTK [Anoté TONG]

Kamaeuraogan Te I-Kiribati Party or KTK [Tetaua TAITAI]

Maurin Kiribati Pati or MKP [Rimeta BENIAMINA]

Note:

There is no tradition of formally organized political parties in Kiribati; they more closely resemble factions or interest groups because they have no party headquarters, formal platforms, or party structures

Suffrage:

18 years of age; universal

Leader Biography

Leader Biography

President Anote Tong, the head of state and head of government of Kiribati --

Anote Tong is the president of Kiribati. He won the election in July 2003 and was re-elected on October 17, 2007, for a second term.

The son of an Chinese migrant and of a Gilbertese woman, Anote Tong attended St Bede's College for his secondary school education, graduated from Canterbury University with a degree in Science, and then gained a Masters in Economics degree from the London School of Economics.

A fierce advocate of global action on climate change, Anote Tong has brought attention to the existential crisis facing Kiribati and other Pacific countries, as a result of the rise in sea level.

He is married and has seven children.

Note that elections were scheduled to be held in 2011; see below for details.

A parliamentary election was set to be held in Kiribati in October 2011. A first round was expected on Oct. 21, 2011, with a second round a week later on Oct. 28, 2011. At stake were the seats in the unicameral House of Parliament or "Maneaba Ni Maungatabu" composed of 46 seats. Forty-four members are elected by popular vote, there is one ex officio member - the attorney general, and one member is nominated by the Rabi Council of Leaders (representing Banaba Island) to serve four-year terms.

Note that voting on two islands in Kiribati was delayed until Oct. 24, 2011, due to delays in the delivery of ballot papers to Fanning Island and Washington Island. As noted by chief electoral officer, Rine Ueara, on the problem of delivering ballots to those two islands: “They’re far from Christmas Island. They need the boat from Christmas Island to deliver the papers but [because of] problems with shipping lines the papers won’t be there until Sunday. We won’t be on counting on Fanning and Washington but all the results from other electoral districts will be transferred to the central office and they will be announced on that night.” The second round of elections ensued on Oct. 28, 2011, as scheduled.

A presidential election was originally set to take place on Dec. 30, 2011, but later changed to Jan. 13, 2011. The presidential vote would occur in the aftermath of parliamentary elections, which were held in Kiribati in October 2011. In those elections, the incumbent President Anote Tong's Pillars of Truth secured 15 seats, the United Coalition Party of Tetaua Taitai took 10 seats, and the Maurin Kiribati Pati of Rimeta Beniamina won three seats, with the remainder going to independents.

With the parliamentary vote completed, the new composition of the incoming parliament would determine the winner of the presidential contest. Typically, the presidency is determined on the basis of the parliamentary election results. The president is elected to serve four-year terms. The incumbent president was Anote Tong, who has served since 2003 and was elected most recently during elections of 2007. Among the other candidates were Dr. Tetaua Taitai, and the previous parliament’s opposition leader, Rimeta Beniamina.

The main issues at the heart of the 2012 presidential contest were Taiwanese and Chinese aid, copra prices and pensions.

Note that when the votes were counted, incumbent President Anote Tong won re-election with 42 percent of the total vote. Tetaua Taitai was his nearest challenger, securing 35 percent of the vote share. Rimeta Beniamina took 23 percent. Tong carried 14 out of the 23 constituencies but his

overall vote tally was significantly less than the 64 percent landslide victory he enjoyed in 2007. Nevertheless, voter turnout in 2012 was high at 68 percent and the election was brought to a conclusion peacefully.

President Anote Tong was officially sworn into office less than a week after winning a third term as the island nation's leader.

NOTE:

A parliamentary election was held in Kiribati in late 2015. A first round of voting was held on Dec. 30, 2015, with a second round following on Jan. 7, 2016 for contests where a given candidate failed to secure an outright majority. which has controlled politics in Kiribati for some time, as well as Taaneti Mamau, the representative of an opposition coalition.

Foreign Relations

General Relations

Kiribati was admitted as the 186th member of the United Nations in September 1999.

Regional Relations

Kiribati maintains cordial relations with most countries and has close relations with its Pacific neighbors, Japan, Australia and New Zealand; the latter three provide the majority of the country's foreign aid. Taiwan and Japan also have specified-period licenses to fish in Kiribati's waters.

In November 1999, it was announced that Japan's National Space Development Agency' plans to lease land on Kirimati (Christmas Island) for 20 years on which to build a spaceport. Japan will pay \$840,000 per year and will also pay for any damage to roads and the environment. The site is designated as the landing strip for a drone shuttle called HOPE-X and may possibly also serve as a launch pad for satellites.

Relations with United States

In September 1979, a treaty of friendship was signed between the Republic of Kiribati and the United States (U.S.). In 1983, the U.S. Senate approved recognition of Kiribati's sovereignty over the Line and Phoenix island groups.

The U.S. has no consular or diplomatic offices in Kiribati. Officers of the American Embassy in Majuro, Republic of the Marshall Islands, are concurrently accredited to Kiribati and make periodic

visits.

Relations with the U.S. have focused on toxic materials stored at Palmyra Atoll (an uninhabited U.S. territory).

In late April 1999, Kiribati announced its intention to take control of three islands in the Line and Phoenix group that are currently U.S. territories and house 4,000 Kiribati nationals. The U.S. ambassador to the region dismissed Kiribati's claims, adding that the islands had not been included in the previous negotiations for control of islands in the Line and Phoenix group.

Relations with France

In 1995, relations with France were strained by French nuclear testing at Mururoa Atoll.

Relations with China and Taiwan

Bilateral relations had been good with China because of Kiribati's embracing the "One China" policy, despite allowing Taiwan to fish in its waters.

In 2004, the main issue was a dispute with China following the decision by the government of the Pacific island to establish diplomatic ties with Taiwan. Because China adheres to a "One-China" policy and claims jurisdiction over Taiwan, and because Taiwan rejects this claim, the issue of diplomatic ties with Taiwan has been contentious.

Many countries, such as the United States, although sympathetic to Taiwan, have resisted making official diplomatic ties with Taiwan out of concern that such measures would serve only to ratchet up relations between the mainland and Taiwan. Thus, the decision by Kiribati, under the government of President Tong, to establish such relations was regarded as surprising.

Upon making the decision to establish its allegiance with Taiwan, Kiribati asked China to withdraw its diplomatic personnel. The Chinese government in Beijing, however, refused to comply.

The decision to raise the ire of Beijing may be generally regarded as risky, but for President Tong, it was surmised that he may be prepared to take the risk for the purpose of advancing Kiribati's economy. Several small countries that have similarly recognized Taiwan have benefited from grants and other business incentives from Taiwan.

Nevertheless, President Tong announced in August 2004 that he believed Beijing was attempting to destabilize his government as a measure of retribution for its decision to establish ties with Taiwan.

The president's brother, Harry Tong, who is also the opposition leader (mentioned above), expressed his belief that the real threat to Kiribati was Taiwan, rather than China.

The Politics of the Environment

In 2002, the major international issues facing many Pacific island states involved environmental challenges -- a consequence of global warming, according to several scientific studies. In this regard, Kiribati, like other islands in the Pacific, will launch legal action against developed countries at international venues, such as the International Court of Justice, for polluting practices which make them most liable for global warming. Most Pacific island countries may be washed away in the future, as a consequence of global warming and the resulting rise in sea level. Meanwhile, they suffer from biodiversity depletion and a lack of freshwater sources. These serious challenges are also linked to global warming. The refusal of the United States and Australia to sign the Kyoto Protocol raises the level of alarm in the Pacific region.

In June 2008, at an address for World Environment Day, President Anote Tong called for assistance in evacuating the citizens of Kiribati as it disappears due to climate change and the concomitant rise in sea level. President Tong noted that with the rise of sea level, salt water was encroaching on water supplies, land was being eroded, crops were being destroyed, and communities were being forced to move further inland. With the country at risk of being completely submerged, the people may eventually have no choice but to leave.

In June 2008, at an address for World Environment Day, President Anote Tong called for assistance in evacuating the citizens of Kiribati as it disappears due to climate change and the concomitant rise in sea level. President Tong noted that with the rise of sea level, salt water was encroaching on water supplies, land was being eroded, crops were being destroyed, and communities were being forced to move further inland. With the country at risk of being completely submerged, the people may eventually have no choice but to leave. To this end, President Tong said, "We may be beyond redemption," he said. "We may be at the point of no return, where the emissions in the atmosphere will carry on contributing to climate change, to produce a sea level change so in time our small, low-lying islands will be submerged."

The executive director of the United Nations Environment Program, Achim Steiner, described Kiribati's environmental crisis as follows: "It's a humbling prospect when a nation has to begin talking about its own demise, not because of some inevitable natural disaster... but because of what we are doing on this planet." Steiner called for "collective purpose" to combat global climate change.

In 2009, the United Nations' General Assembly convened in New York with Pacific island leaders

continuing their call for global action on climate change. According to Radio Australia, several Pacific leaders and representatives addressed the United Nations General Assembly, with all of them demanding greater understanding of the effects of climate change on their island nations, which are particularly vulnerable to the rise in sea level. Indeed, this issue represents an existential crisis for these Pacific island countries. In addition, they called on the developed world to use the upcoming climate change meeting in Copenhagen -- scheduled for December 2009 -- to adopt policies that would reduce carbon emissions.

In particular, Kiribati's President Anote Tong said all countries should accept responsibility for the effects of climate change. He said, "And I fear our children and grandchildren will look back and ask us the question - how is it they knew what they knew and yet they did so little." He continued, "Let us not waste any more time on talk, drafting amendments, posturing and empty platitudes. We know what needs to be done. This might be our last chance."

In December 2009, the United Nations Climate Change Summit opened in the Danish capital of Copenhagen. The summit was scheduled to last from Dec. 7-18, 2009. Delegates from more than 190 countries were in attendance, and approximately 100 world leaders, including British Prime Minister Gordon Brown and United States President Barack Obama, were expected to participate. At issue was the matter of new reductions targets on greenhouse gas emissions by 2020.

On Dec. 9, 2009, four countries -- the United Kingdom, Australia, Mexico and Norway -- presented a document outlining ideas for raising and managing billions of dollars, which would be intended to help vulnerable countries dealing with the perils of climate change. Described as a "green fund," the concept could potentially help small island states at risk because of the rise in sea level. The "green fund" would fall under the rubric of the United Nations Framework Convention on Climate Change, for which developed countries have been committed to quantifying their emission reduction targets, and also to providing financial and technical support to developing countries.

On Dec. 11, 2009, China demanded that developed and wealthy countries in Copenhagen should help deliver a real agreement on climate change by delivering on their promises to reduce carbon emissions and provide financial support for developing countries to adapt to global warming. China's Vice Foreign Minister also emphasized the fact that climate change was "a matter of survival" for developing countries, and accordingly, such countries need wealthier and more developed countries to accentuate not only their pledges of emissions reduction targets, but also their financial commitments under the aforementioned United Nations Framework Convention on Climate Change. To that end, scientists and leaders of small island states in the Indian Ocean, the Pacific Ocean and the Caribbean Sea, have highlighted the existential threat posed by global warming and the concomitant rise in sea level.

China and India were joined by Brazil and South Africa in the crafting of a draft document calling

for a new global climate treaty to be completed by June 2010. Of concern has been the realization that there was insufficient time to find concurrence on a full legal treaty, which would leave countries only with a politically-binding text by the time the summit at Copenhagen closed. But Guyana's leader, President Bharrat Jagdeo, warned that the summit in Denmark would be classified as a failure unless a binding document was agreed upon instead of just political consensus. He urged his cohorts to act with purpose saying, "Never before have science, economics, geo-strategic self-interest and politics intersected in such a way on an issue that impacts everyone on the planet."

Likewise, Tuvalu demanded that legally binding agreements emerge from Copenhagen. Its proposal was supported by many of the vulnerable countries, from small island states and sub-Saharan Africa, all of whom warned of the catastrophic impact of climate change on their citizens. Tuvalu also called for more aggressive action, such as an amendment to the 1992 agreement, which would focus on sharp greenhouse gas emissions and the accepted rise in temperatures, due to the impact the rise in seas. The delegation from Kiribati joined the call by drawing attention to the fact that one village had to be abandoned due to waist-high water, and more such effects were likely to follow. Kiribati's Foreign Secretary, Tessie Lambourne, warned that the people of Kiribati could well be faced with no homeland in the future saying, "Nobody in this room would want to leave their homeland." But despite such impassioned pleas and irrespective of warnings from the Intergovernmental Panel on Climate Change that the rise in sea level from melting polar ice caps would deleteriously affect low-lying atolls such as Tuvalu and Kiribati in the Pacific, and the Maldives in the Indian Ocean, the oil-giant Saudi Arabia was able to block this move.

By Dec. 12, 2009, details related to a draft document prepared by Michael Zammit Cutajar, the head of the Ad-hoc Working Group on Long-Term Cooperative Action, were released at the Copenhagen climate conference. Included in the document were calls for countries to make major reductions in carbon emissions over the course of the next decade. According to the Washington Post, industrialized countries were called on to make cuts of between 25 percent and 40 percent below 1990 levels -- reductions that were far more draconian than the United States was likely to accept. As discussed above, President Obama had offered a provisional reduction target of 17 percent. The wide gap between the released draft and the United States' actual stated position suggested there was much more negotiating in the offing if a binding agreement could be forged, despite the Obama administration's claims that it was seeking greater engagement on this issue.

The division between developed and developing countries in Copenhagen reached new heights on Dec. 14, 2009, when some of the poor and less developed countries launched a boycott at the summit. The move, which was spurred by African countries but backed by China and India, appeared to be geared toward redirecting attention and primary responsibility to the wealthier and more industrialized countries. The impasse was resolved after the wealthier and more industrialized countries offered assurances that they did not intend on shirking from their

commitments to reducing greenhouse gases. As a result, the participating countries ceased the boycott.

In March 2012, officials of Kiribati were in discussions aimed at purchasing land from another country due to the existential threat faced as a result of the rise of sea level in this low-lying Pacific nation state. To this end, Kiribati's President Anote Tong was considering the purchase of land on Vanua Levu -- Fiji's second largest island. The land would be used to resettle some citizens, to extract earth for sea defense from rising ocean water, and also for the production of crops.

As noted repeatedly by President Tong, climate change poses an existential threat to Kiribati, with global warming contributing to the rise in sea level, and the encroachment onto inhabitable land in his country. He acknowledged that Kiribati would ultimately lose this battle and that his country had to be prepared to deal with all possibilities in the future, including moving his people to another destination -- the inherent difficulty of such an endeavor notwithstanding. Kiribati was also looking to other countries in the region, such as Australia and New Zealand, in the hopes that they would accept some citizens of Kiribati for resettlement purposes. Another potential option being envisioned by the president was the construction of man-made islands akin to oil rigs upon which the citizens of Kiribati might live.

Editor's Note:

Kiribati, once known as the Gilbert Islands, is made up of 33 coral atolls and sits amidst two million square miles of Pacific Ocean. With its highest point only six feet above sea level, Kiribati has been particularly vulnerable to the rise of sea level as a result of global climate change. In Kiribati, ecological concerns and the climate crisis have also been dominant themes with life and death consequences for the people of Kiribati. Indeed, their very livelihoods of fishing and subsistence farming remain at risk as a result of ecological and environmental changes. Yet even so, Kiribati is threatened by increasingly high storm surges, which could wipe out entire villages and contaminate water supplies. Moreover, Kiribati's very existence is thus at severe risk of being obliterated from the map. As such, policies have also centered on emergency planning for worst case scenarios in this vulnerable country. Kiribati's government has also concluded that the people will have to choose but to leave the islands and it has called on the international community to assist in this regard. This call has come after years of attempting to draw international attention to the plight of global climate change and its dire consequences for small island states. The case of Kiribati illuminates the emerging global challenge of environmental refugees.

National Security

External Threats

No foreign power poses an immediate threat to Kiribati's national security. It maintains generally equitable relations with other nations. It has forged particularly close bonds with its Pacific Rim neighbors: Australia, Japan, Fiji and New Zealand. Australia and New Zealand provide for the defense of Kiribati, as the sparsely populated island nation has no armed forces of its own.

Kiribati's longstanding relationship with another regional power suffered a recent setback, however. Kiribati and China began to exchange diplomats in the 1980s. Their relationship assumed a decidedly more strategic air when President Teburoro Tito (1994 – 2003) allowed China to set up a satellite listening post in South Tarawa. His successor, Anote Tong, established full diplomatic relations with Taiwan, however. China has since closed the listening post soon after and diplomatic ties have been severed as well.

Crime

Kiribati has a generally low crime rate.

Insurgencies

There are no armed insurgencies in Kiribati. The residents of Banaba Island have expressed a strong interest in transforming their homeland into a protectorate of Fiji, however. Many of the island's former inhabitants have immigrated to Fiji. Only 200 to 300 remain on Banaba. Kiribati's central government has taken steps to placate them, including returning land previously acquired by the government for phosphate mining as well as granting the Banabans a seat in the national legislature.

Terrorism

Terrorism does not constitute a clear and present danger to Kiribati. Kiribati is in the beginning stages of complying with the international counter-terrorism protocols. In 2004, it began to introduce legislation in regards to terrorism and trans-national crime. Kiribati recognizes that it has a ways to go and continues to ask for assistance from the international community to support them in getting where they need to be in reference to the fight on terrorism.

Kiribati is not party to any of the United Nations' international conventions and protocols pertaining

to terrorism.

Chapter 3

Economic Overview

Economic Overview

Overview

Kiribati is a country consisting of 33 low-lying atolls spreading across the North Pacific Ocean. Like other Pacific island countries, Kiribati is far from major markets, has few natural resources and a narrow economic base. Production and exports are limited to copra, fish and seaweed, and the economy is vulnerable to fluctuations in world commodity demand and prices. The public sector dominates the economy, and external grants account for around 60 percent of GDP. Kiribati is also one of the most vulnerable countries in the world to sea level rise. However, the geography also provides a key sources of revenues, including fishing license fees, seamen remittances, and revenues from the trust fund (derived from phosphate up to 1979).

After strong growth in 2008, the economy contracted in 2009 with falling copra prices, remittances from seafarers and returns on investments in the Revenue Equalization Reserve Fund, as a result of the global economic crisis. Economic growth was expected to pick up moderately in 2010 with higher copra prices, an increase in demand for seafarers, and better returns from offshore investments. The economy indeed recovered in the second half of 2010 and inflation pressure dissipated. Tourist arrivals climbed by 20 percent over 2009 and credit growth began to pick up in the second half of 2010. The fiscal position strengthened and budget planning improved in 2010. Authorities unveiled a three-year budget framework in 2010, and structural reform momentum – particularly in privatizing SOEs -- gained traction at the end of 2010. GDP grew by about 4 percent in 2011 and slowed to about in 2012, a year in which growth was driven by projects financed by development partners, including airport and seaport reconstruction and road works. Inflation remained negative due to lower prices of rice and some other staples. Meanwhile, the current account deficit widened slightly because of an increase in imports of equipment associated with infrastructure projects, which was partially offset by high fishing license fees. Growth was projected to slow even further in 2013 as construction reached completion.

In 2013, Kiribati sustained its growth for three consecutive years, supported by donor projects and private sector activity. Inflation remained subdued, underpinned by moderate commodity prices, but was projected to pick up to 2.5 percent in 2014 on account of increased expenditures related to major donor-funded infrastructure projects.

The high fishing license revenues in 2013 resulted in an overall budget surplus of 10 percent of GDP despite a substantial increase of capital expenditure. Tax revenue continued to lag, however, as underperforming state-owned enterprises (SOEs) and tax compliance issues contained

government's tax collections.

Kiribati's economic growth in 2014 was being fueled by public spending on projects financed by development partners, and subsequent spillover effects on wholesale and retail sales. Also, the steady pace of reform to state-owned enterprises was expected to spur private sector growth. The value-added tax introduced on April 1, 2014, was designed to help enhance revenue mobilization. Growth was still expected to moderate in 2015, as work on infrastructure projects wound down, but less than the forecast in the Asian Development Outlook (ADO) 2014 in April 2014.

In Kiribati, stimulus from ongoing infrastructure projects appeared to have been greater than previously forecast, and low energy prices encouraged more consumption, according to the Asian Development Bank. Lending to households grew by 26 percent in 2014 as the Kiribati Provident Fund and the Development Bank of Kiribati introduced personal lending schemes.

Recent higher public expenditures prompted a doubling of the growth forecast for 2015. Although infrastructure projects were scheduled to wind down in 2016, their positive influence on economic activity was expected to persist.

Economic Performance

In recent years, Kiribati's economic performance has been weak and fluctuated widely due to poor performance of the agriculture sector, in particular a decline in copra and seaweed production. Continued infrastructure problems and a lack of progress in creating a favorable environment for private sector investment also contributed to the poor performance. Real GDP growth declined sharply to a negative rate in 2007, before picking up in 2008 due to strong recovery in agricultural and public sector activity. Growth turned negative again in 2009 as a result of the global economic crisis before moving back to positive territory in 2010.

The fiscal balance has been in large deficit that has been financed by a drawdown from the Revenue Equalization Reserve Fund (RERF, a trust fund established in 1956 by the British colonial government with phosphate mining royalties), as the RERF is the main source of deficit financing. Owing to large draw-downs in recent years, along with the global decline in asset values, the RERF declined to more than 40 percent below its peak in 2000.

According to CountryWatch estimated calculations for 2014:

Real GDP growth rate was: 1.8 percent

The fiscal deficit/surplus as percent of GDP (%) was: 14.1 percent

Inflation was measured at: 2.2 percent

Updated in 2015

**Please note that the figures in our Economic Performance section are estimates or forecasts based on IMF-based data that are formulated using CountryWatch models of analysis.*

Economic Performance Index

Economic Performance Index

The Economic Performance rankings are calculated by CountryWatch's editorial team, and are based on criteria including sustained economic growth, monetary stability, current account deficits, budget surplus, unemployment and structural imbalances. Scores are assessed from 0 to 100 using this aforementioned criteria as well as CountryWatch's proprietary economic research data and models.

	Bank stability risk	Monetary/ Currency stability	Government Finances	Empl./ Unempl.	Econ.GNP growth or decline/ forecast

Chapter 4

Investment Overview

Foreign Investment Climate

Background

A remote country of 33 scattered coral atolls, Kiribati has few natural resources and is one of the least developed Pacific Islands. Commercially viable phosphate deposits were exhausted at the time of independence from the UK in 1979. Copra and fish now represent the bulk of production and exports. The economy has fluctuated widely in recent years. Economic development is constrained by a shortage of skilled workers, weak infrastructure, and remoteness from international markets. Tourism provides more than one-fifth of GDP. Private sector initiatives and a financial sector are in the early stages of development. Foreign financial aid from the EU, UK, US, Japan, Australia, New Zealand, Canada, UN agencies, and Taiwan accounts for 20-25% of GDP. Remittances from seamen on merchant ships abroad account for more than \$5 million each year. Kiribati receives around \$15 million annually for the government budget from an Australian trust fund.

Foreign Investment Assessment

Openness to Foreign Investment

The government of Kiribati is actively pursuing foreign investment. Foreign investment has been a key focus since 1985 when the Foreign Investment Act (FIA) was passed, which implemented an incentive program to attract foreign capital. The FIA called for a the Foreign Investment Commission to screen application and installed an incentive program which included duty-free imports of capital equipment, free repatriation of profits and tax breaks in some sectors. The Seventh National Development Plan, which was implemented between 1992 and 1995, initiated a program of infrastructure development, privatization, development of key economic sectors and the promotion of foreign investment. However, due to lack of organization, the program fell short of its lofty goals. The Eighth National Development Plan was initiated in 1996 and continued through 1999.

Despite these efforts to attract investment, Kiribati has met with little success. The application procedure needs streamlining and Kiribati's limited resources and restrictive location are still major hurdles that may be hard to overcome.

In late 1999, the IMF praised advances in Kiribati's economy but also called on the government to reduce trade barriers and make further efforts to attract foreign investment.

Transparency of Regulatory System

N/A

Labor Force

Total: 7,870 economically active, not including subsistence farmers

By occupation: N/A

Agriculture and Industry

Agriculture products: copra, taro, breadfruit, sweet potatoes, vegetables; fish

Industries: fishing, handicrafts

Import Commodities and Partners

Commodities: foodstuffs, machinery and equipment, miscellaneous manufactured goods, fuel

Partners: Australia 41.5%, Fiji 26.6%, New Zealand 8.9%, Japan 5.9%

Export Commodities and Partners

Commodities: copra 62%, coconuts, seaweed, fish

Partners: Japan 74.2%, Australia 7.4%, US 7.1%, Thailand 5.2%

Telephone System

Telephones- main lines in use: 4,500

Telephones- mobile cellular: 500

General Assessment: generally good quality national and international service

Domestic: wire line service available on Tarawa and Kiritimati; connections to outer islands by HF/VHF radiotelephone; wireless service available in Tarawa since 1999

International: country code - 686; Kiribati is being linked to the Pacific Ocean Cooperative Telecommunications Network, which should improve telephone service; satellite earth station - 1

Intelsat (Pacific Ocean)

Internet

Internet Hosts: N/A

Internet users: 2,000

Roads, Airports, Ports and Harbors

Railways: N/A

Highways: 670 km

Ports and harbors: Banaba, Betio, English Harbour, Kanton

Airports: 20; w/paved runways: 3

Legal System and Considerations

N/A

Dispute Settlement

The judiciary is independent and free of governmental interference.

The judiciary consists of a high court, magistrate courts, a court of appeal, and land courts. Litigants also have the right of appeal to the Privy Council in London.

The right to a fair public trial is provided by law and observed in practice. The Constitution provides that an accused person be informed of the nature of the offense with which he is charged and be provided adequate time and facilities to prepare a defense. The right to confront witnesses, present evidence, and appeal convictions is provided for in law. Procedural safeguards are based on English common law.

Corruption Perception Ranking

N/A

Cultural Considerations

In Kiribati is okay to address people by their first names. However, it is important that one always dress modestly, even when on the beach. Also, the locals believe that Sunday is truly the day of rest. Don't expect much business activity on this day.

For more information see:

United States' State Department Commercial Guide

Foreign Investment Index

Foreign Investment Index

The Foreign Investment Index is a proprietary index measuring attractiveness to international investment flows. The Foreign Investment Index is calculated using an established methodology by CountryWatch's Editor-in-Chief and is based on a given country's economic stability (sustained economic growth, monetary stability, current account deficits, budget surplus), economic risk (risk of non-servicing of payments for goods or services, loans and trade-related finance, risk of sovereign default), business and investment climate (property rights, labor force and laws, regulatory transparency, openness to foreign investment, market conditions, and stability of government). Scores are assigned from 0-10 using the aforementioned criteria. A score of 0 marks the lowest level of foreign investment viability, while a score of 10 marks the highest level of foreign investment viability, according to this proprietary index.

Zambia	4.5-5
Zimbabwe	3.5

Editor's Note:

As of 2015, the global economic crisis (emerging in 2008) had affected many countries across the world, resulting in changes to their rankings. Among those countries affected were top tier economies, such as the [United Kingdom](#), [Iceland](#), [Switzerland](#) and [Austria](#). However, in all these cases, their rankings have moved back upward in the last couple of years as anxieties have eased. Other top tier countries, such as [Spain](#), [Portugal](#), [Ireland](#), and [Italy](#), suffered some effects due to debt woes and the concomitant effect on the euro zone. Greece, another euro zone nation, was also downgraded due to its sovereign debt crisis; however, Greece's position on the precipice of default incurred a sharper downgrade than the other four euro zone countries mentioned above. Cyprus' exposure to Greek bank yielded a downgrade in its case. Slovenia and [Latvia](#) have been slightly downgraded due to a mix of economic and political concerns but could

easily be upgraded in a future assessment, should these concerns abate. Meanwhile, the crisis in eastern [Ukraine](#) fueled downgrades in that country and neighboring [Russia](#).

Despite the "trifecta of tragedy" in [Japan](#) in 2011 -- the earthquake, the ensuing tsunami, and the resulting nuclear crisis -- and the appreciable destabilization of the economic and political terrain therein, this country has only slightly been downgraded. Japan's challenges have been assessed to be transient, the government remains accountable, and there is little risk of default. Both [India](#) and China retain their rankings; [India](#) holds a slightly higher ranking than [China](#) due to its record of democratic representation and accountability.

There were shifts in opposite directions for [Mali](#) and [Nigeria](#) versus the [Central African Republic](#), [Burkina Faso](#), and [Burundi](#). [Mali](#) was slightly upgraded due to its efforts to return to constitutional order following the 2012 coup and to neutralize the threat of separatists and Islamists. Likewise, a new government in [Nigeria](#) generated a slight upgrade as the country attempts to confront corruption, crime, and terrorism. But the [Central African Republic](#) was downgraded due to the takeover of the government by Seleka rebels and the continued decline into lawlessness in that country. Likewise, the attempts by the leaders of [Burundi](#) and [Burkina Faso](#) to hold onto power by by-passing the constitution raised eyebrows and resulted in downgrades.

Political unrest in [Libya](#) and [Algeria](#) have contributed to a decision to marginally downgrade these countries as well. [Syria](#) incurred a sharper downgrade due to the devolution into de facto civil war and the dire security threat posed by Islamist terrorists. [Iraq](#) saw a similar downgrade as a result of the takeover of wide swaths of territory and the threat of genocide at the hands of Islamist terrorists. [Yemen](#), likewise, has been downgraded due to political instability at the hands of secessionists, terrorists, Houthi rebels, and the intervention of external parties. Conversely, [Egypt](#) and [Tunisia](#) saw slight upgrades as their political environments stabilize.

At the low end of the spectrum, devolving security conditions and/or economic crisis have resulted in countries like [Pakistan](#), [Afghanistan](#), [Somalia](#), and [Zimbabwe](#) maintaining their low ratings.

The [United States](#) continues to retain its previous slight downgrade due to the enduring threat of default surrounding the debt ceiling in that country, matched by a conflict-ridden political climate. In the case of [Mexico](#), there is limited concern about default, but increasing alarm over the security situation in that country and the government's ability to contain it. In [Argentina](#), a default to bond holders resulted in a downgrade to that country. Finally, a small but significant upgrade was attributed to [Cuba](#) due to its recent pro-business reforms and its normalization of ties with the United States.

Corruption Perceptions Index

Corruption Perceptions Index

Transparency International: [Corruption Perceptions Index](#)

Editor's Note:

Transparency International's [Corruption Perceptions Index](#) is a composite index which ranks countries in terms of the degree to which corruption is perceived to exist among public officials. This index indicates the views of national and international business people and analysts about the levels of corruption in each country. The highest (and best) level of transparency is indicated by the number, 10. The lower (and worse) levels of transparency are indicated by lower numbers.

179	Afghanistan	1.3	4	1.0 - 1.5
180	Somalia	1.1	3	0.9 - 1.4

Methodology:

As noted above, the highest (and best) level of transparency with the least perceived corruption is indicated by the number, 10. The lower (and worse) levels of transparency are indicated by lower numbers.

According to Transparency International, the [Corruption Perceptions Index](#) (CPI) table shows a country's ranking and score, the number of surveys used to determine the score, and the confidence range of the scoring.

The rank shows how one country compares to others included in the index. The CPI score

indicates the perceived level of public-sector corruption in a country/territory.

The CPI is based on 13 independent surveys. However, not all surveys include all countries. The surveys used column indicates how many surveys were relied upon to determine the score for that country.

The confidence range indicates the reliability of the CPI scores and tells us that allowing for a margin of error, we can be 90% confident that the true score for this country lies within this range.

Note:

Kosovo, which separated from the Yugoslav successor state of [Serbia](#), is not listed above. No calculation is available for [Kosovo](#) at this time, however, a future corruption index by Transparency International may include the world's newest country in its tally. Taiwan has been listed above despite its contested status; while Taiwan claims sovereign status, [China](#) claims ultimate jurisdiction over Taiwan. Hong Kong, which is also under the rubric of Chinese sovereignty, is listed above. Note as well that Puerto Rico, which is a [United States](#) domain, is also included in the list above. These inclusions likely have to do with the size and fairly autonomous status of their economies.

Competitiveness Ranking

Competitiveness Ranking

Editor's Note:

The Global Competitiveness Report's competitiveness ranking is based on the Global Competitiveness Index (GCI), which was developed for the World Economic Forum. The GCI is based on a number of competitiveness considerations, and provides a comprehensive picture of the

competitiveness landscape in countries around the world. The competitiveness considerations are: institutions, infrastructure, macroeconomic environment, health and primary education, higher education and training, goods market efficiency, labour market efficiency, financial market development, technological readiness, market size, business sophistication, and innovation. The rankings are calculated from both publicly available data and the Executive Opinion Survey.

Country/Economy	GCI 2010 Rank	GCI 2010 Score	GCI 2009 Rank	Change 2009-2010
Switzerland	1	5.63	1	0

Methodology:

The competitiveness rankings are calculated from both publicly available data and the Executive Opinion Survey, a comprehensive annual survey conducted by the World Economic Forum together with its network of Partner Institutes (leading research institutes and business organizations) in the countries covered by the Report.

Highlights according to WEF --

- The [United States](#) falls two places to fourth position, overtaken by [Sweden](#) and [Singapore](#) in the rankings of the World Economic Forum's Global Competitiveness Report 2010-2011
- The People's Republic of [China](#) continues to move up the rankings, with marked improvements in several other Asian countries
- [Germany](#) moves up two places to fifth place, leading the Eurozone countries
- [Switzerland](#) tops the rankings

Chapter 5

Social Overview

People

Cultural Demography

The total population of Kiribati total approximately 100,000.

The native people of Kiribati are called "I-Kiribati." The word "Kiribati" is actually the local spelling of the word "Gilbert" and the original name of this British colony was the Gilbert Islands. In 1979 when independence was gained, the indigenous format of the name was adopted.

Ethnically, the Kiribati people are Micronesians, but recent archeological evidence indicates that Austronesians originally settled the islands thousands of years ago. Around the 14th century, Fijians and Tongans invaded the islands thus complicating the ethnic range, and there are also people of Polynesian ancestry further diversifying the ethnic typologies. Inter-marriage among all ancestral groups, however, has led to a population reasonably homogeneous in appearance and traditions.

The people of Kiribati speak a Micronesian dialect called Gilbertese or I-Kiribati, however, English is the official language. English is not used very often outside the island capital of Tarawa. It is more likely that English is mixed in its use with Gilbertese. Older generations of I-Kiribati tend to use more complicated versions of Gilbertese.

Christianity is the major religion, having been introduced by missionaries in the 19th century. The population is predominantly Roman Catholic, although a substantial portion of the population is Congregationalist Protestant. Many other Protestant denominations, including more evangelical types, are also represented, and the Baha'i religion also exists in Kiribati.

Human Development

The population of Kiribati has a life expectancy at birth of 62.85 years (59.79 for males, and 66.06 for females) and an infant mortality rate of 44.69 deaths per 1,000 live births.

The people of Kiribati mostly live in villages with populations between 50 and 3,000 on the outer islands. Most houses are made of materials obtained from coconut and pandanus trees. Frequent

droughts hinder reliable large-scale agriculture, so the islanders have largely turned to the sea for livelihood. Most are outrigger sailors and fishers. Copra plantations serve as a second source of employment. In recent years, large numbers of citizens have moved to the more urban island capital of Tarawa.

To increase opportunities for the islanders, the government has placed greater emphasis on education. Primary education is free and compulsory for the first six years, now being extended to nine years. Mission schools are slowly being absorbed into the government primary school system. Higher education is expanding; students may seek technical, teacher or marine training, or study in other countries. To date, most choosing to do the latter have gone to Fiji.

About 3.3 percent of GDP is spend on health expenditures. Access to sanitation, water, and health care is considered to be average; however, standards are less than optimal in rural areas.

Written by Dr. Denise Youngblood Coleman, Editor in Chief, www.countrywatch.com; see Bibliography for list research sources.

Human Development Index

Human Development Index

Human Development Index (Ranked Numerically)

The [Human Development Index](#) (HDI) is used to measure quality of life in countries across the world. The HDI has been compiled since 1990 by the United Nations Development Programme (UNDP) on a regular basis. The HDI is a composite of several indicators, which measure a country's achievements in three main arenas of human development: longevity, education, and economic standard of living. Although the concept of human development is complicated and cannot be properly captured by values and indices, the HDI offers a wide-ranging assessment of human development in certain countries, not based solely upon traditional economic and financial indicators. For more information about the methodology used to calculate the HDI, please see the "Source Materials" in the appendices of this review.

Life Satisfaction Index

Life Satisfaction Index

Life Satisfaction Index

Created by Adrian G. White, an Analytic Social Psychologist at the University of Leicester, the "Satisfaction with Life Index" measures subjective life satisfaction across various countries. The data was taken from a metastudy (see below for source) and associates the notion of subjective happiness or life satisfaction with qualitative parameters such as health, wealth, and access to basic education. This assessment serves as an alternative to other measures of happiness that tend to rely on traditional and quantitative measures of policy on quality of life, such as GNP and GDP. The methodology involved the responses of 80,000 people across the globe.

Commentary:

European countries, such as [Denmark](#), [Iceland](#), [Finland](#), [Sweden](#), [Switzerland](#), [Austria](#) resided at the top of the ranking with highest levels of self-reported life satisfaction. Conversely, European countries such as [Latvia](#), [Lithuania](#), [Moldova](#), [Belarus](#) and [Ukraine](#) ranked low on the index. African countries such as Democratic Republic of Congo, [Zimbabwe](#) and [Burundi](#) found themselves at the very bottom of the ranking, and indeed, very few African countries could be found in the top 100. [Japan](#) was at the mid-way point in the ranking, however, other Asian countries such as [Brunei](#) and [Malaysia](#) were in the top tier, while [Pakistan](#) was close to the bottom with a low level of self-identified life satisfaction. As a region, the Middle East presented a mixed bag with Saudi Arabians reporting healthy levels of life satisfaction and Egyptians near the bottom of the ranking. As a region, Caribbean countries were ranked highly, consistently demonstrating

high levels of life satisfaction. The findings showed that health was the most crucial determining factor in life satisfaction, followed by prosperity and education.

Happy Planet Index

Happy Planet Index

The Happy Planet Index (HPI) is used to measure human well-being in conjunction with environmental impact. The HPI has been compiled since 2006 by the New Economics Foundation. The index is a composite of several indicators including subjective life satisfaction, life expectancy at birth, and ecological footprint per capita.

As noted by NEFA, the HPI "reveals the ecological efficiency with which human well-being is delivered." Indeed, the index combines environmental impact with human well-being to measure the environmental efficiency with which, country by country, people live long and happy lives. The countries ranked highest by the HPI are not necessarily the ones with the happiest people overall, but the ones that allow their citizens to live long and fulfilling lives, without negatively impacting this opportunity for either future generations or citizens of other countries. Accordingly, a country like the [United States](#) will rank low on this list due to its large per capital ecological footprint, which uses more than its fair share of resources, and will likely cause planetary damage.

It should be noted that the HPI was designed to be a counterpoint to other well-established indices of countries' development, such as Gross Domestic Product (GDP), which measures overall national wealth and economic development, but often obfuscates the realities of countries with stark variances between the rich and the poor. Moreover, the objective of most of the world's people is not to be wealthy but to be happy. The HPI also differs from the [Human Development](#)

[Index](#) (HDI), which measures quality of life but not ecology, since it [HPI] also includes sustainability as a key indicator.

*The Gender Development Index (GDI) is a composite index which measures the average achievement in a country. While very similar to the Human Development Index in its use of the same variables, the GDI adjusts the average achievement of each country in terms of life expectancy, enrollment in schools, income, and literacy in accordance to the disparities between males and females.

*The Gender Empowerment Measure (GEM) is a composite index measuring gender inequality in three of the basic dimensions of empowerment; economic participation and decision-making, political participation and decision-making, and power over economic resources.

*Total Fertility Rate (TFR) is defined as the average number of babies born to women during their reproductive years. A TFR of 2.1 is considered the replacement rate; once a TFR of a population reaches 2.1 the population will remain stable assuming no immigration or emigration takes place. When the TFR is greater than 2.1 a population will increase and when it is less than 2.1 a population will eventually decrease, although due to the age structure of a population it will take years before a low TFR is translated into lower population.

*Maternal Mortality Rate is the number of deaths to women per 100,000 live births that resulted from conditions related to pregnancy and or delivery related complications.

*Economically Active Females are the share of the female population, ages 15 and above, whom supply, or are able to supply, labor for the production of goods and services.

*Female Contributing Family Workers are those females who work without pay in an economic enterprise operated by a relative living in the same household.

*Estimated Earned Income is measured according to Purchasing Power Parity (PPP) in US

dollars.

Global Gender Gap Index

Global Gender Gap Index

Editor's Note:

The Global Gender Gap Index by the World Economic Forum ranks most of the world's countries in terms of the division of resources and opportunities among males and females. Specifically, the ranking assesses the gender inequality gap in these four arenas:

1. Economic participation and opportunity (salaries and high skilled employment participation levels)
2. Educational attainment (access to basic and higher level education)
3. Political empowerment (representation in decision-making structures)
4. Health and survival (life expectancy and sex ratio)

*new country 2010

Commentary:

According to the report's index, Nordic countries, such as [Iceland](#), [Norway](#), [Finland](#), and [Sweden](#) have continued to dominate at the top of the ranking for gender equality. Meanwhile, [France](#) has seen a notable decline in the ranking, largely as a result of decreased number of women holding ministerial portfolios in that country. In the Americas, the [United States](#) has risen in the ranking to top the region, predominantly as a result of a decreasing wage gap, as well as higher number of

women holding key positions in the current Obama administration. [Canada](#) has continued to remain as one of the top ranking countries of the Americas, followed by the small Caribbean island nation of Trinidad and Tobago, which has the distinction of being among the top three countries of the Americas in the realm of gender equality. [Lesotho](#) and South African ranked highly in the index, leading not only among African countries but also in global context. Despite [Lesotho](#) still lagging in the area of life expectancy, its high ranking was attributed to high levels of female participation in the labor force and female literacy. The [Philippines](#) and [Sri Lanka](#) were the top ranking countries for gender equality for Asia, ranking highly also in global context. The [Philippines](#) has continued to show strong performance in all strong performance on all four dimensions (detailed above) of the index. Finally, in the Arab world, the [United Arab Emirates](#) held the highest-rank within that region of the world; however, its placement near the bottom of the global list highlights the fact that Arab countries are generally poor performers when it comes to the matter of gender equality in global scope.

Culture and Arts

From the Visit Kiribati Website:

Culture

The culture of Kiribati has greatly been preserved by the isolation that comes with being in the middle of the Pacific Ocean. Although missionaries began to arrive on the shores in the 1850's, much of the traditions and beliefs of the people have remained the same, while the adoption of Christianity has created its own interesting history. Today many of the outer islands live in very traditional ways, and are always very welcoming of guests. Tarawa, the capital of Kiribati, is more influenced by development and globalisation – however spend a little time on Tarawa and you soon find out that beyond the buses, nightlife and shops people maintain traditional customs, values and way of life.

Community

The essence of community is common – people form community through sharing of objects, environments and spaces, and this is a lot in Kiribati. With many people in a small place, people share the natural resources that they live off. The I-Kiribati people often live in close quarters with their extended family, and living and working in harmony with neighbours and family is of high importance. Few things go unnoticed in a small community, and privacy becomes a premium. As each family still feeds for itself, things such as the best places for fishing, handicraft techniques and other skills are kept within the family. While today's international companies might think they invented 'strategic intelligence' and the 'knowledge economy', the I-Kiribati have been doing this for centuries.

The Maneaba and Celebration

At the centre of community life is the Maneaba – a rectangular structure used as a meeting place for the village community. This is where traditional meetings are held, including celebrations known as botaki. The I-Kiribati hold a very special celebration for the 1st birthday of their children, especially for their first born child. Other big botakis include weddings and the 21st birthday. All of the extended family will contribute to funding the botaki.

Celebration is something the Kiribati people certainly love. Any visitors to Kiribati in the Christian events of Easter or Christmas will see many botakis, and as much traditional dancing and singing as one could ever wish for. The same goes for Kiribati Independence Day (the 12th of July), when there is competitions in dancing, choir, singing, and various sporting events including traditional wrestling, canoe and miniature canoe racing, and Oreano, a sport involving throwing large heavy balls toward the other team and hoping they can not catch it.

Daily Life

Traditional daily life in Kiribati is revolves around living off the resources of the island – this might be taking the sailing canoe out to catch fish for the daily meal, cutting toddy to drink, harvesting coconuts or breadfruit, or weaving craft from the leave of the coconut tree. The island and

surrounding sea provide everything, from food, shelter, clothing, furniture, or medicine. In much of Kiribati, particularly the outer islands, this traditional lifestyle is everyday existence, governed by the extended family unit and the island council. Even in the more developed South Tarawa, you will see the men climbing coconut trees to cut toddy every morning, and see traditional dancing and singing at celebrations and botakis.

Modern and Traditional

It is difficult to draw a line between the modern culture of Kiribati and the traditional as the two are intricately interwoven. Christianity was brought to Kiribati in the 1850's and has been readily adopted, and now adds an extra layer. Globalisation, development and rapid population growth have heavily influenced the capital of South Tarawa, though you will find traditional kia-kias next to brick houses. Behind the busses, bars and restaurants there is still traditional values, beliefs and customs. You might find the Kiribati youth working hard on the sporting field, with sport taken very seriously. At the same time they are quick to break into laughter. Endeavours on the sporting field might be followed by a traditional style meeting, where the young people practice traditional speeches, leadership and ritual ; this is part in keeping with their norm, and also practice for the formal environment they will soon encounter as adults in the Maneaba.

In contrast, on the outer islands you will find people living traditional lives, the same way they have for centuries. To add to this, different islands have cultural differences and customs - for example, in Abaiang there is one islet that has a custom of doing the traditional island welcome anti-clockwise, while every other island in Kiribati has a clockwise traditional welcome.

Etiquette

Cultural Dos and Taboos

1. It is fine to address people by their first names.
2. There are three different group responses to money in Kiribati. In the south, people prefer not borrow, especially money. However, in the central and the northern groups they use the system barter-system, which involves sharing and exchanging foods and money. Overall, I-Kiribati people are very kind and helpful so when someone is requesting them for some money they will give it.
3. Always dress modestly, even on the beach.
4. Never touch a person's head, as it is believed to be the most sacred part of the body.
5. Remove shoes before entering a person's home. Never sit in a position where the toes are pointing into the home.
6. The locals believe that Sunday is truly the day of rest. Don't expect much business activity on this day.
7. Throwing things is considered wrong form, largely due to the history and fears of throwing knives.
8. Saying "no" is generally regarded as rude as it considered uncaring of someone else's need; instead of "no," the people of Kiribati tend to say "sorry" followed by an explanation.
9. Due to the belief that people are paramount, asking someone to come back later because you are too busy doing something at the moment is considered very rude and uncaring in Kiribati culture.

Travel Information

Please Note

This is a generalized travel guide and it is intended to coalesce several resources, which a

traveler might find useful, regardless of a particular destination. As such, it does not include travel warnings for specific "hot spot" destinations.

For travel alerts and warnings, please see the United States Department of State's listings available at URL:

<http://travel.state.gov/content/passports/english/alertswarnings.html>

Please note that travel to the following countries, based on these warnings, is ill-advised, or should be undertaken with the utmost precaution:

Afghanistan, Algeria, Burundi, Cameroon, Central African Republic, Chad, Colombia, Democratic Republic of Congo, Djibouti, El Salvador, Eritrea, Ethiopia, Guinea, Honduras, Iraq, Iran, Lebanon, Liberia, Libya, Mali, Mauritania, Mexico, Nepal, Niger, Nigeria, North Korea, Pakistan, Palestinian Territories of West Bank and Gaza, Philippines areas of Sulu Archipelago, Mindanao, and southern Sulu Sea, Saudi Arabia, Sierra Leone, Somalia, South Sudan, Sudan, Syria, Ukraine, Venezuela, and Yemen.

International Travel Guide

Checklist for Travelers

- 1. Take out travel insurance to cover hospital treatment or medical evacuation. Overseas medical costs are expensive to most international travelers, where one's domestic, nationalized or even private health insurance plans will not provide coverage outside one's home country. Learn about "reciprocal insurance plans" that some international health care companies might offer.**
- 2. Make sure that one's travel insurance is appropriate. If one intends to indulge in adventurous activities, such as parasailing, one should be sure that one is fully insured in such cases. Many traditional insurance policies do not provide coverage in cases of extreme circumstances.**
- 3. Take time to learn about one's destination country and culture. Read and learn about the place one is traveling. Also check political, economic and socio-cultural developments at the destination by reading country-specific travel reports and fact sheets noted below.**
- 4. Get the necessary visas for the country (or countries) one intends to visit - but be aware that a visa does not guarantee entry. A number of useful sites regarding visa and other entry requirements are noted below.**
- 5. Keep in regular contact with friends and relatives back at home by phone or email, and be sure to leave a travel itinerary.**
- 6. Protect one's personal information by making copies of one's passport details, insurance policy, travelers checks and credit card numbers. Taking copies of such documents with you, while**

leaving another collection copies with someone at home is also good practice for travelers. Taking copies of one's passport photograph is also recommended.

7. Stay healthy by taking all possible precautions against illness. Also, be sure to take extra supplies of prescription drugs along for the trip, while also taking time to pack general pharmaceutical supplies, such as aspirin and other such painkillers, bandages, stomach ailment medication, anti-inflammatory medication and anti-bacterial medication.

8. Do not carry illicit drugs. Understand that the punishment for possession or use of illegal drugs in some countries may be capital punishment. Make sure your prescription drugs are legal in the countries you plan to visit.

9. Know the laws of one's destination country and culture; be sure to understand the repercussions of breaking those laws and regulations. Often the transparency and freedoms of the juridical system at home is not consistent with that of one's destination country. Become aware of these complexities and subtleties before you travel.

10. For longer stays in a country, or where the security situation is volatile, one should register one's self and traveling companions at the local embassy or consulate of one's country of citizenship.

11. Women should take care to be prepared both culturally and practically for traveling in a different country and culture. One should be sure to take sufficient supplies of personal feminine products and prescription drugs. One should also learn about local cultural standards for women, including norms of dressing. Be aware that it is simply inappropriate and unsafe for women to travel alone in some countries, and take the necessary precautions to avoid risk-filled situations.

12. If one is traveling with small children, one should pack extra supplies, make arrangements with the travel carrier for proper seating that would adequately accommodate children, infants or toddlers. Note also that whether one is male or female, traveling with children means that one's hands are thus not free to carry luggage and bags. Be especially aware that this makes one vulnerable to pickpockets, thieves and other sorts of crime.

13. Make proper arrangements for accommodations, well in advance of one's arrival at a destination. Some countries have limited accommodation, while others may have culturally distinctive facilities. Learning about these practicalities before one travels will greatly aid the enjoyment of one's trip.

14. Travel with different forms of currency and money (cash, traveler's checks and credit cards) in anticipation that venues may not accept one or another form of money. Also, ensuring that one's financial resources are not contained in one location, or by one person (if one is traveling with others) can be a useful measure, in the event that one loses a wallet or purse.

15. Find out about transportation in the destination country. In some places, it might be advisable to hire a local driver or taxi guide for safety reasons, while in other countries, enjoying one's travel experience may well be enhanced by renting a vehicle and seeing the local sights and culture independently. Costs may also be prohibitive for either of these choices, so again, prior planning is suggested.

Tips for Travelers

The Republic of Kiribati (pronounced kir-ree-bas) is an island group in the Western Pacific Ocean, consisting of an archipelago of some 30 low-lying coral atolls surrounded by extensive reefs with a total land area of 800 square kilometers. Kiribati gained independence from the United Kingdom in 1979. Kiribati has an elected President and a legislative assembly. The capital of Kiribati is Tarawa. Kiribati includes three administrative units, sixteen atolls of the former Gilbert Islands, eight atolls of the former Line Islands (including Christmas Island and Fanning Island), and eight atolls of the former Phoenix Islands. Kiribati has few natural resources, and its economy is very small. The islands are not self-sufficient in food. Tourist facilities are not widely available.

A valid passport and visa are required. Visa requirements include one application form, two photos and a fee. There is no Embassy of Kiribati in the United States. For information on entry requirements, please contact the Honorary Consulate of the Republic of Kiribati, Suite 503, 850 Richards Street, Honolulu, HI 96813, telephone (808) 529-7703; fax (808)521-8304. For visa or other information, travelers may consult the Consular Section of the nearest British embassy or consulate.

The loss or theft of a passport abroad should be reported immediately to the local police and to the nearest appropriate embassy.

Doctors and hospitals often expect immediate cash payment for health services. Uninsured travelers who require medical care overseas may face extreme difficulties.

Please check with your own insurance company to confirm whether your policy applies overseas, including provision for medical evacuation, and for adequacy of coverage. Serious medical problems requiring hospitalization and/or medical evacuation can cost tens of thousands of dollars. Please ascertain whether payment will be made to the overseas hospital or doctor or whether you will be reimbursed later for expenses that you incur. Some insurance policies also include coverage for psychiatric treatment and for disposition of remains in the event of death.

While in a foreign country, you may encounter road conditions that differ significantly from those in your country. The information below concerning the Kiribati is provided for general reference only, and may not be totally accurate in a particular location or circumstance.

Safety of Public Transportation: Poor

Urban Road Conditions/Maintenance: Poor

Rural Road Conditions/Maintenance: Poor

Availability of Roadside Assistance: Poor

Traffic moves on the left side of the road. Roads in urban Tarawa and Christmas Island, while satisfactory in some areas, are generally in need of repair. After heavy rains, some road sections

experience temporary flooding. Vehicle traffic proceeds at a relatively slow rate. Drinking and driving is a common practice, especially on the weekends. Since visibility is poor with no streetlights, drivers should be careful when driving at night.

For specific information concerning Kiribati driver's permits, vehicle inspection, road tax and mandatory insurance, please contact the Honorary Consulate of the Republic of Kiribati, 850 Richards Street, Suite 503, Honolulu, HI 96813, tel. (808) 529-7703, fax (808) 521-8304.

The Republic of Kiribati's customs authorities strictly prohibit the importation of firearms, ammunition, explosives and indecent publications. Strict quarantine laws govern the import of any part of plants, fruits, vegetables, soil, as well as animals and animal products. Visitors are not allowed to export human remains, artifacts that are 30 or more years old, traditional fighting swords, traditional tools, dancing ornaments or suits of armor. For more information, please contact the British Embassy.

While in a foreign country, you are subject to that country's laws and regulations. Persons violating Kiribati's laws, even unknowingly, may be expelled, arrested, or imprisoned. Penalties for possession, use, or trafficking in illegal drugs in Kiribati are strict, and convicted offenders can expect jail sentences and heavy fines.

In Kiribati, the Australian dollar is the legal currency. Travelers' checks and all major currencies are accepted by banks and may also be exchanged for local currency at some local hotels. Visa and MasterCard are accepted at most hotels.

Note: This information is directly quoted from the United States Department of State Consular Information Sheet.

Diseases/Health Data

Please Note: Most of the entry below constitutes a generalized health advisory, which a traveler might find useful, regardless of a particular destination.

As a supplement, however, reader will also find below a list of countries flagged with current health notices and alerts issued by the Centers for Disease Control and Prevention (CDC).

Please note that travel to the following countries, based on these 3 levels of warnings, is ill-advised, or should be undertaken with the utmost precaution:

Level 3 (highest level of concern; avoid non-essential travel) --

Guinea - Ebola

Liberia - Ebola

Nepal - Earthquake zone

Sierra Leone - Ebola

Level 2 (intermediate level of concern; use utmost caution during travel) --

Cameroon - Polio

Somalia - Polio

Vanuatu - Tropical Cyclone zone

Throughout Middle East and Arabia Peninsula - MERS ((Middle East Respiratory Syndrome)

Level 1 (standard level of concern; use practical caution during travel) -

Australia - Ross River disease
Bosnia-Herzegovina - Measles
Brazil - Dengue Fever
Brazil - Malaria
Brazil - Zika
China - H7N9 Avian flu
Cuba - Cholera
Egypt - H5N1 Bird flu
Ethiopia - Measles
Germany - Measles
Japan - Hand, foot, and mouth disease (HFMD)
Kyrgyzstan - Measles
Malaysia -Dengue Fever
Mexico - Chikungunya
Mexico - Hepatitis A
Nigeria - Meningitis
Philippines - Measles
Scotland - Mumps
Singapore - Hand, foot, and mouth disease (HFMD)
South Korea - MERS ((Middle East Respiratory Syndrome)
Throughout Caribbean - Chikungunya
Throughout Central America - Chikungunya
Throughout South America - Chikungunya
Throughout Pacific Islands - Chikungunya

For specific information related to these health notices and alerts please see the CDC's listing available at URL:

<http://wwwnc.cdc.gov/travel/notices>

Health Information for Travelers to Kiribati

The preventive measures you need to take while traveling in this region depend on the areas you visit and the length of time you stay. You should observe the precautions listed in this document in most areas of this region. However, in highly developed areas of Australia and New Zealand, you should observe health precautions similar to those that would apply while traveling in the United States.

Travelers' diarrhea, the number one illness in travelers, can be caused by viruses, bacteria, or

parasites, which can contaminate food or water. Infections may cause diarrhea and vomiting (*E. coli*, *Salmonella*, cholera, and parasites), fever (typhoid fever and toxoplasmosis), or liver damage (hepatitis). Make sure your food and drinking water are safe (see below).

Malaria is a preventable infection that can be fatal if left untreated. Prevent infection by taking prescription antimalarial drugs and protecting yourself against mosquito bites (see below). A high risk for malaria exists all year in Papua New Guinea, the Solomon Islands, and Vanuatu. Travelers to these areas should take mefloquine for malaria prevention. For more detailed information about specific locations, see Malaria Information for Travelers to Australia and the South Pacific (<http://www.cdc.gov/travel/regionalmalaria/austspac.htm>).

A certificate of yellow fever vaccination may be required for entry into certain of these countries if you are coming from a tropical South American or sub-Saharan African country. (There is no risk of yellow fever in Australia and the South Pacific.) For detailed information, see Comprehensive Yellow Fever Vaccination Requirements (<http://www.cdc.gov/travel/yelfever.htm>).

Dengue, filariasis, Ross River virus, and Murray Valley encephalitis are diseases carried by insects that also occur in this region. Protecting yourself against insect bites (see below) will help to prevent these diseases.

CDC Recommends the Following Vaccines (as Appropriate for Age):

See your doctor at least 4-6 weeks before your trip to allow time for shots to take effect.

- Hepatitis A or immune globulin (IG) (except for Australia and New Zealand).
- Rabies, if you might be exposed to wild or domestic animals through your work or recreation.
- Typhoid (except for Australia and New Zealand), particularly if you are visiting developing countries in this region.
- As needed, booster doses for tetanus-diphtheria and measles, and a one-time dose of polio for adults. Hepatitis B vaccine is now recommended for all infants and for children 11-12 years of age who did not receive the series as infants.

All travelers should take the following precautions, no matter the destination:

- Wash hands often with soap and water.
- Because motor vehicle crashes are a leading cause of injury among travelers, walk and drive defensively. Avoid travel at night if possible and always use seat belts.
- Always use latex condoms to reduce the risk of HIV and other sexually transmitted diseases.
- Don't eat or drink dairy products unless you know they have been pasteurized.
- Don't share needles with anyone.
- Eat only thoroughly cooked food or fruits and vegetables you have peeled yourself. Remember:

boil it, cook it, peel it, or forget it.

- Never eat undercooked ground beef and poultry, raw eggs, and unpasteurized dairy products. Raw shellfish is particularly dangerous to persons who have liver disease or compromised immune systems.

Travelers visiting undeveloped areas should take the following precautions:

To Stay Healthy, Do:

- Drink only bottled or boiled water, or carbonated (bubbly) drinks in cans or bottles. Avoid tap water, fountain drinks, and ice cubes. If this is not possible, make water safer by BOTH filtering through an "absolute 1-micron or less" filter AND adding iodine tablets to the filtered water. "Absolute 1-micron filters" are found in camping/outdoor supply stores.
- If you visit an area where there is risk for malaria, take your malaria prevention medication before, during, and after travel, as directed. (See your doctor for a prescription.)
- Protect yourself from insects by remaining in well-screened areas, using repellents (applied sparingly at 4-hour intervals), and wearing long-sleeved shirts and long pants from dusk through dawn.
- To prevent fungal and parasitic infections, keep feet clean and dry, and do not go barefoot.

To Avoid Getting Sick:

- Don't eat food purchased from street vendors.
- Don't drink beverages with ice.
- Don't share needles with anyone.
- Don't handle animals (especially monkeys, dogs, and cats), to avoid bites and serious diseases (including rabies and plague).

What You Need To Bring with You:

- Long-sleeved shirt and long pants to wear while outside whenever possible, to prevent illnesses carried by insects.
- Insect repellent containing DEET (diethylmethyltoluamide), in 30%-35% strength for adults and 6%-10% for children, as well as a bed net impregnated with the insecticide permethrin. (Bed nets can be purchased in camping or military supply stores.)
- Over-the-counter antidiarrheal medicine to take if you have diarrhea.
- Iodine tablets and portable water filters to purify water if bottled water is not available.
- Sunblock, sunglasses, hat.
- Prescription medications: make sure you have enough to last during your trip, as well as a copy of the prescription(s).

After You Return Home:

If you have visited an area where there is risk for malaria, continue taking your malaria medication weekly for 4 weeks after you leave the area.

If you become ill—even as long as a year after your trip—tell your doctor the areas you have visited.

For More Information:

Ask your doctor or check CDC web sites for more information about how to protect yourself against diseases that occur in Australia and the South Pacific, such as:

For information about diseases-

Carried by Insects

Dengue, Malaria, Murray Valley Encephalitis

Carried in Food or Water

Escherichia coli, diarrhea, Hepatitis A, Typhoid Fever

Person-to-Person Contact

Hepatitis B, HIV/AIDS

For more information about these and other diseases, please check the Diseases (<http://www.cdc.gov/travel/diseases.htm>) section and the Health Topics A-Z (<http://www.cdc.gov/health/diseases.htm>).

Note:

Kiribati is located in the Australia and the Pacific health region.

Chapter 6

Environmental Overview

Environmental Issues

General Overview:

Kiribati has scant natural resources in terms of both arable land and fresh water. Banaba or Ocean Island was one of the Pacific Ocean 's main phosphate mining sites from the beginning of the 20th century until 1979, when the resource was fully depleted. Maritime resources are significant; Kiribatiderives significant income from fishing right allocations to foreign fleets operating in its 200-mile economic zone. Fisheries conservation is likely to become a critical issue within the near future. The islands also display an impressive diversity of bird life.

Especially on the most densely populated island of Tarawa, local pollution problems have arisen through use of lagoons for latrines and for dumping. The possibility that this contamination may affect groundwater supplies poses a particularly great concern.

Current Issues:

- anthropogenic climatic warming
- rise in sea level
- crop losses

Total Greenhouse Gas Emissions (Mtc):

0.0

Country Rank (GHG output):

184th

Natural Hazards:

- typhoons
- drought

The Politics of the Environment

In 2002, the major international issues facing many Pacific island states involved environmental challenges -- a consequence of global warming, according to several scientific studies. In this regard, [Kiribati](#), like other islands in the Pacific, will launch legal action against developed countries at international venues, such as the International Court of Justice, for polluting practices which make them most liable for global warming. Most Pacific island countries may be washed away in the future, as a consequence of global warming and the resulting rise in sea level. Meanwhile, they suffer from biodiversity depletion and a lack of freshwater sources. These serious challenges are also linked to global warming. The refusal of the [United States](#) and [Australia](#) to sign the Kyoto Protocol raises the level of alarm in the Pacific region.

In 2006, attention was on the environment when [Kiribati](#) created a marine reserve, which gained the distinction of being the third largest in the world. Because the Phoenix Islands Protected Area is the habitat of a plethora of species of fish and coral, fishing was prohibited in its waters.

In June 2008, at an address for World Environment Day, President Anote Tong called for assistance in evacuating the citizens of [Kiribati](#) as it disappears due to climate change and the concomitant rise in sea level. President Tong noted that with the rise of sea level, salt water was encroaching on water supplies, land was being eroded, crops were being destroyed, and communities were being forced to move further inland. With the country at risk of being completely submerged, the people may eventually have no choice but to leave.

In June 2008, at an address for World Environment Day, President Anote Tong called for assistance in evacuating the citizens of [Kiribati](#) as it disappears due to climate change and the concomitant rise in sea level. President Tong noted that with the rise of sea level, salt water was encroaching on water supplies, land was being eroded, crops were being destroyed, and communities were being forced to move further inland. With the country at risk of being completely submerged, the people may eventually have no choice but to leave. To this end, President Tong said, "We may be beyond redemption," he said. "We may be at the point of no return, where the emissions in the atmosphere will carry on contributing to climate change, to produce a sea level change so in time our small, low-lying islands will be submerged."

The executive director of the United Nations Environment Program, Achim Steiner, described Kiribati's environmental crisis as follows: "It's a humbling prospect when a nation has to begin talking about its own demise, not because of some inevitable natural disaster... but because of what we are doing on this planet." Steiner called for "collective purpose" to combat global climate change.

In 2009, the United Nations' General Assembly convened in New York with Pacific island leaders continuing their call for global action on climate change. According to Radio [Australia](#), several Pacific leaders and representatives addressed the United Nations General Assembly, with all of them demanding greater understanding of the effects of climate change on their island nations, which are particularly vulnerable to the rise in sea level. Indeed, this issue represents an existential crisis for these Pacific island countries. In addition, they called on the developed world to use the upcoming climate change meeting in Copenhagen -- scheduled for December 2009 -- to adopt policies that would reduce carbon emissions.

In particular, Kiribati's President Anote Tong said all countries should accept responsibility for the effects of climate change. He said, "And I fear our children and grandchildren will look back and ask us the question - how is it they knew what they knew and yet they did so little." He continued, "Let us not waste any more time on talk, drafting amendments, posturing and empty platitudes. We know what needs to be done. This might be our last chance."

In December 2009, the United Nations Climate Change Summit opened in the Danish capital of Copenhagen. The summit was scheduled to last from Dec. 7-18, 2009. Delegates from more than 190 countries were in attendance, and approximately 100 world leaders, including British Prime Minister Gordon Brown and [United States](#) President Barack Obama, were expected to participate. At issue was the matter of new reductions targets on greenhouse gas emissions by 2020.

On Dec. 9, 2009, four countries -- the [United Kingdom](#), [Australia](#), [Mexico](#) and [Norway](#) -- presented a document outlining ideas for raising and managing billions of dollars, which would be intended to help vulnerable countries dealing with the perils of climate change. Described as a "green fund," the concept could potentially help small island states at risk because of the rise in sea level. The "green fund" would fall under the rubric of the United Nations Framework Convention on Climate Change, for which developed countries have been committed to quantifying their emission reduction targets, and also to providing financial and technical support to developing countries.

On Dec. 11, 2009, [China](#) demanded that developed and wealthy countries in Copenhagen should help deliver a real agreement on climate change by delivering on their promises to reduce carbon emissions and provide financial support for developing countries to adapt to global warming. China's Vice Foreign Minister also emphasized the fact that climate change was "a matter of survival" for developing countries, and accordingly, such countries need wealthier and more

developed countries to accentuate not only their pledges of emissions reduction targets, but also their financial commitments under the aforementioned United Nations Framework Convention on Climate Change. To that end, scientists and leaders of small island states in the Indian Ocean, the Pacific Ocean and the Caribbean Sea, have highlighted the existential threat posed by global warming and the concomitant rise in sea level.

China and [India](#) were joined by [Brazil](#) and [South Africa](#) in the crafting of a draft document calling for a new global climate treaty to be completed by June 2010. Of concern has been the realization that there was insufficient time to find concurrence on a full legal treaty, which would leave countries only with a politically-binding text by the time the summit at Copenhagen closed. But Guyana's leader, President Bharrat Jagdeo, warned that the summit in [Denmark](#) would be classified as a failure unless a binding document was agreed upon instead of just political consensus. He urged his cohorts to act with purpose saying, "Never before have science, economics, geo-strategic self-interest and politics intersected in such a way on an issue that impacts everyone on the planet."

Likewise, [Tuvalu](#) demanded that legally binding agreements emerge from Copenhagen. Its proposal was supported by many of the vulnerable countries, from small island states and sub-Saharan Africa, all of whom warned of the catastrophic impact of climate change on their citizens. [Tuvalu](#) also called for more aggressive action, such as an amendment to the 1992 agreement, which would focus on sharp greenhouse gas emissions and the accepted rise in temperatures, due to the impact the rise in seas. The delegation from [Kiribati](#) joined the call by drawing attention to the fact that one village had to be abandoned due to waist-high water, and more such effects were likely to follow. Kiribati's Foreign Secretary, Tessie Lambourne, warned that the people of [Kiribati](#) could well be faced with no homeland in the future saying, "Nobody in this room would want to leave their homeland." But despite such impassioned pleas and irrespective of warnings from the Intergovernmental Panel on Climate Change that the rise in sea level from melting polar ice caps would deleteriously affect low-lying atolls such as such as [Tuvalu](#) and [Kiribati](#) in the Pacific, and the [Maldives](#) in the Indian Ocean, the oil-giant [Saudi Arabia](#) was able to block this move.

By Dec. 12, 2009, details related to a draft document prepared by Michael Zammit Cutajar, the head of the Ad-hoc Working Group on Long-Term Cooperative Action, were released at the Copenhagen climate conference. Included in the document were calls for countries to make major reductions in carbon emissions over the course of the next decade. According to the Washington Post, industrialized countries were called on to make cuts of between 25 percent and 40 percent below 1990 levels -- reductions that were far more draconian than the [United States](#) was likely to accept. As discussed above, President Obama had offered a provisional reduction target of 17 percent. The wide gap between the released draft and the United States' actual stated position suggested there was much more negotiating in the offing if a binding agreement could be forged, despite the Obama administration's claims that it was seeking greater engagement on this issue.

The division between developed and developing countries in Copenhagen reached new heights on Dec. 14, 2009, when some of the poor and less developed countries launched a boycott at the summit. The move, which was spurred by African countries but backed by [China](#) and [India](#), appeared to be geared toward redirecting attention and primary responsibility to the wealthier and more industrialized countries. The impasse was resolved after the wealthier and more industrialized countries offered assurances that they did not intend on shirking from their commitments to reducing greenhouse gases. As a result, the participating countries ceased the boycott.

In March 2012, officials of [Kiribati](#) were in discussions aimed at purchasing land from another country due to the existential threat faced as a result of the rise of sea level in this low-lying Pacific nation state. To this end, Kiribati's President Anote Tong was considering the purchase of land on Vanua Levu -- Fiji's second largest island. The land would be used to resettle some citizens, to extract earth for sea defense from rising ocean water, and also for the production of crops.

As noted repeatedly by President Tong, climate change poses an existential threat to [Kiribati](#), with global warming contributing to the rise in sea level, and the encroachment onto inhabitable land in his country. He acknowledged that [Kiribati](#) would ultimately lose this battle and that his country had to be prepared to deal with all possibilities in the future, including moving his people to another destination -- the inherent difficulty of such an endeavor notwithstanding. [Kiribati](#) was also looking to other countries in the region, such as [Australia](#) and [New Zealand](#), in the hopes that they would accept some citizens of [Kiribati](#) for resettlement purposes. Another potential option being envisioned by the president was the construction of man-made islands akin to oil rigs upon which the citizens of [Kiribati](#) might live.

Climate change talks in [Qatar](#) extend life of Kyoto Protocol

December 2012 saw climate talks ensue in the Qatari city of Doha as representatives from countries across the world gathered to discuss the fate of the Kyoto Protocol, which seeks to minimize greenhouse gas emissions. The summit yielded results with decisions made (1) to extend the Kyoto Protocol until 2020, and (2) for wealthier countries to compensate poorer countries for the losses and damage incurred as a result of climate change.

In regards to the second matter, Malia Talakai of [Nauru](#), a leading negotiator for the Alliance of Small Island States, explained the necessity of the compensation package as follows: “We are trying to say that if you pollute you must help us.”

This measure was being dubbed the "Loss and Damage" mechanism, and was being linked with

[United States](#) President Barack Obama's request for \$60 billion from Congress to deal with the devastation caused by Hurricane Sandy months before. The sight of a hurricane bearing down on the northern Atlantic seaboard, along with the reality of the scope of reconstruction, appeared to have illustrated the economic costs of climate change -- not so much as a distant environmental issue -- but as a danger to the quotidian lives of people. Still, there was blame to be placed on the [United States](#) and European countries -- some of world's largest emitters -- for failing to do more to reduce emissions.

To that latter end, there was in fact little progress made on the central issue of reducing greenhouse gas emissions. Had those emissions been reduced, there would have been less of a need to financially deal with the devastation caused by climate change. One interpretation was that the global community was accepting the fact that industrialization was contributing to global warming, which had deleterious effects on the polar ice caps and concomitantly on the rise of sea level, with devastating effects for small island nations. Thus, wealthier countries were willing to pay around \$10 billion a year through 2020, effectively in "damages," to the poor countries that could be viewed as the "collateral damage" of industrial progress. But damages today could potentially be destruction tomorrow, leaving in place the existential challenges and burdens to be born by some of the world's smallest and least wealthy island countries.

Perhaps not surprisingly, the representative for the small island nation states at the Doha summit responded with ire, characterizing the lack of progress on reducing emissions as follows: "We see the package before us as deeply deficient in mitigation (carbon cuts) and finance. It's likely to lock us on the trajectory to a 3,4,5C rise in global temperatures, even though we agreed to keep the global average temperature rise of 1.5C to ensure survival of all islands. There is no new finance (for adapting to climate change and getting clean energy) -- only promises that something might materialize in the future. Those who are obstructive need to talk not about how their people will live, but whether our people will live."

Editor's Entry on [Environmental Policy](#):

Like so many small island nations in the world, [Kiribati](#) is vulnerable to the threats posed by global warming and climate change, derived from carbon emissions, and resulting in the rise in sea level. Political policy in the country is often connected to ecological issues, which have over time morphed into an existential crisis of sorts.

Indeed, in most small island countries not just in the Pacific, but also the Caribbean and Indian Ocean, ecological concerns and the climate crisis have been dominant themes with dire life and death consequences looming in the background for their people. Small island nations in these region are already at risk from the rise of sea-level, tropical cyclones, floods. But their very

livelihoods of fishing and subsistence farming are also at risk as a result of ecological and environmental changes. Of particular concern is the matter of ocean acidification, which destroys reefs and decimates fish and shellfish populations that provide protein for inhabitants. At the same time, increasingly high storm surges can wipe out coastlines, and even entire villages, while contaminating water supplies. Accordingly, the very existence of islands are at severe risk of being obliterated from the map. Yet even with the existential threat of being wiped off the map in the offing, the international community has been either slow or restrictive in its efforts to deal with global warming, climate change, economic and ecological damage, as well as the emerging global challenge of environmental refugees.

A 2012 report from the United Nations Environment Program (UNEP) and the Pacific Regional Environment Program underlined the concerns of small island nations and their people as it concluded that the livelihoods of approximately 10 million people in Pacific island communities were increasingly vulnerable to climate change. In fact, low-lying islands in that region would likely confront losses of up to 18 percent of gross domestic product due to climate change, according to the report. The report covers 21 countries and territories, including [Fiji](#), [Kiribati](#), [Samoa](#) and [Tonga](#), and recommended environmental legislation intended to deal with the climate crisis facing the small island countries particularly. As noted by David Sheppard, the director general of the Pacific Regional Environment Program that co-sponsored this study: "The findings... emphasize the need more than ever to raise the bar through collective actions that address the region's environmental needs at all levels."

For more information on the threats faced in small island nations by climate change and the measures being undertaken to lobby for international action, please see the Alliance for Small Island States available online at the URL: <http://aosis.org/>

Small island countries announce plan to sue multinational fossil fuel corporations for their role in climate change --

In mid-2015, six small island nation states -- [Vanuatu](#), [Kiribati](#), [Tuvalu](#), [Fiji](#), [Solomon Islands](#) and [Philippines](#) -- released a manifesto on climate change. Dubbed the "People's Declaration for Climate Justice," the declaration announced a plan to sue large multinational fossil fuel corporations, which they blamed for carbon pollution, the degradation to their ecosystems, and the other deleterious effects of climate change. The highlights of the manifesto read as follows: "We, the people of [Vanuatu](#), [Kiribati](#), [Tuvalu](#), [Fiji](#), [Solomon Islands](#) and the [Philippines](#) continue to experience the impacts of climate change -- the single biggest human rights, environmental and humanitarian crisis of our time... As the people most acutely vulnerable to the impacts of climate change, we will not let the big polluters decide and assign our fate... We commit to holding those most responsible for climate change accountable. By doing so, we send a message of hope that the

people and not the polluters are in charge of humanity's destiny. " In truth, the effort to sue the world's largest fossil fuel corporations would not be a simple endeavor and the plaintiff nation states might not even see their day in court; however, small island countries were not willing to silently accept the pressing environmental threat to their existence without seeking accountability.

COP 21 summit in Paris ends with historic agreement to tackle climate change; rare international consensus formed on environmental crisis facing the planet --

In mid-December 2015, the highly-anticipated United Nations climate conference of parties (COP) in Paris, [France](#), ended with a historic agreement. In fact, it would very likely be understood as the most significant international agreement signed by all the recognized countries of the world since the Cold War. Accordingly, the Paris Agreement was being distinguished as the first multilateral pact that would compel all countries across the world to cut its carbon emissions -- one of the major causes of increasing greenhouse gas emissions, which contribute to global warming, and its deleterious effects ranging from the dangerous rise in sea level to catastrophic climate change.

The accord, which was dubbed to be the "Paris Agreement," was the work of rigorous diplomacy and fervent environmental advocacy, and it aimed to address the climate change crisis facing the planet. As many as 195 countries were represented in the negotiations that led to the landmark climate deal. Indeed, it was only after weeks of passionate debate that international concurrence was reached in addressing the environmental challenges confronting the world, with particular attention to moving beyond fossil fuels and reducing greenhouse gas emissions.

The success of the COP 21 summit in Paris and the emergence of the landmark Paris Agreement was, to some extent, attributed to the efforts of France's Foreign Minister Laurent Fabius who presided over the negotiations. The French foreign minister's experience and credentials as a seasoned diplomat and respected statesman paid dividends. He skillfully guided the delegates from almost 200 countries and interest groups along the negotiations process, with ostensibly productive results and a reasonably robust deal to show for it.

On Dec. 12, 2015, French Foreign Minister Fabius officially adopted the agreement, declaring: "I now invite the COP to adopt the decision entitled Paris Agreement outlined in the document. Looking out to the room I see that the reaction is positive, I see no objections. The Paris agreement is adopted." Once Foreign Minister Fabius' gavel was struck, symbolically inaugurating the Paris Agreement into force, the COP delegate rushed to their feet with loud and bouyant cheers as well as thunderous applause.

In general, the Paris Agreement was being hailed as a victory for enviromental activists and a

triumph for international diplomats, while at the same time being understood as simply an initial -- and imperfect -- move in the direction of a sustainable future. China's chief negotiator, Xie Zhenhua, issued this message, saying that while the accord was not ideal, it should "not prevent us from marching historical steps forward."

United States President Barack Obama lauded the deal as both "ambitious" and "historic," and the work of strenuous multilateral negotiations as he declared, "Together, we've shown what's possible when the world stands as one." The [United States](#) leader acknowledged that the accord was not "perfect," but he reminded the critics that it was "the best chance to save the one planet we have."

Former [United States](#) Vice President Al Gore, one of the world's most well known environmental advocates, issued a lengthy statement on the accomplishments enshrined in the Paris Agreement. He highlighted the fact that the Paris Agreement was a first step towards a future with a reduced carbon footprint on Planet Earth as he said, "The components of this agreement -- including a strong review mechanism to enhance existing commitments and a long-term goal to eliminate global-warming pollution this century -- are essential to unlocking the necessary investments in our future. No agreement is perfect, and this one must be strengthened over time, but groups across every sector of society will now begin to reduce dangerous carbon pollution through the framework of this agreement."

The central provisions of the Paris Agreement included the following items:

- Greenhouse gas emissions should peak as quickly as possible, with a move towards balancing energy sources, and ultimately the decrease of greenhouse gases in the second half of this century
- Global temperature increase would be limited to 1.5 degrees Centigrade above pre-industrial levels and would be held "well below" the two degrees Centigrade threshold
- Progress on these goals would be reviewed every five years beginning in 2020 with new greenhouse gas reduction targets issued every five years
- \$100 billion would be expended each year in climate finance for developing countries to move forward with green technologies, with further climate financing to be advanced in the years beyond

It should be noted that there both legally binding and voluntary elements contained within the Paris Agreement. Specifically, the submission of an emissions reduction target and the regular review of that goal would be legally mandatory for all countries. Stated differently, there would be a system in place by which experts would be able to track the carbon-cutting progress of each country. At the same time, the specific targets to be set by countries would be determined at the discretion of the countries, and would not be binding. While there was some criticism over this non-binding element, the fact of the matter was that the imposition of emissions targets was believed to be a major factor in the failure of climate change talks in Copenhagen, [Denmark](#), in 2009.

In 2015, the talks faced challenges as several countries, such as [China](#) and [India](#), objected to conditions that would stymie economic and development. In order to avoid that kind of landmine, a system Intended Nationally Determined Contributions (INDCs) was developed and formed the basis of the accord. As such, the Paris Agreement would, in fact, facilitate economic growth and development, as well as technological progress, but with the goal of long-term ecological sustainability based on low carbon sources. In fact, the agreement heralded as "the beginning of the end of the fossil fuel era." As noted by Nick Mabey, the head of the climate diplomacy organization E3G, said, "Paris means governments will go further and faster to tackle climate change than ever before. The transition to a low carbon economy is now unstoppable, ensuring the end of the fossil fuel age."

A particular sticking point in the agreement was the \$100 billion earmarked for climate financing for developing countries to transition from traditional fossil fuels to green energy technologies and a low carbon future. In 2014, a report by the International Energy Agency indicated that the cost of that transition would actually be around \$44 trillion by the mid-century -- an amount that would render the \$100 billion being promised to be a drop in the proverbial bucket. However, the general expectation was that the Republican-controlled Senate in the [United States](#), which would have to ratify the deal in that country, was not interested in contributing significant funds for the cause of climate change.

A key strength of the Paris Agreement was the ubiquitous application of measures to all countries. Of note was the frequently utilized concept of "flexibility" with regard to the Paris Agreement. Specifically, the varying capacities of the various countries in meeting their obligations would be anticipated and accorded flexibility. This aspect presented something of a departure from the 1997 Kyoto Protocol, which drew a sharp distinction between developed and developing countries, and mandated a different set of obligations for those categories of countries. Thus, under Kyoto, [China](#) and [India](#) were not held to the same standards as the [United States](#) and European countries. In the Paris Agreement, there would be commitments from all countries across the globe.

Another notable strength of the Paris Agreement was the fact that the countries of the world were finally able to reach consensus on the vital necessity to limit global temperature increases to 1.5 degrees Centigrade. Ahead of the global consensus on the deal, and as controversy continued to surface over the targeted global temperature limits, the leaders of island countries were sounding the alarm about the melting of the Polar ice caps and the associated rise in seal level. Prime Minister Enele Sopoaga of [Tuvalu](#) issued this dismal reminder: "Tuvalu's future ... is already bleak and any further temperature increase will spell the total demise of [Tuvalu](#). No leader in this room carries such a level of worry and responsibility. Just imagine you are in my shoes, what would you do?" It was thus something of a victory for environmental advocates that the countries of the world could find consensus on the lower number -- 1.5 degrees rather than 2 degrees.

A significant weak point with regard to the Paris deal was a "loss and damage" provision, which anticipates that even with all the new undertakings intended to reduce greenhouse gas emissions and move to a low carbon future, there would nonetheless be unavoidable climate change consequences. Those consequences ranged from the loss of arable land for farmers as well as soil erosion and contamination of potable water by sea water, to the decimation of territory in coastal zones and on small islands, due to the rise in sea level, with entire small island countries being rendered entirely uninhabitable. The reality was that peoples' homes across the world would be destroyed along with their way of life.

With that latter catastrophic effect being a clear and present danger for small island countries, the Association of Small Island States (AOSIS) demanded that the developed world acknowledge its responsibility for this irreversible damage.. Despite the fact that greenhouse gas emissions and the ensuing plague of global warming was, indeed, the consequence of development in the West (the [United States](#) and Europe) and the large power house countries, such as [Russia](#), [China](#) and [India](#), there was no appetite by those countries to sign on to unlimited liability. Under the Paris Agreement, there was a call for research on insurance mechanisms that would address loss and damage issues, with recommendations to come in the future.

The call for research was being regarded as an evasion of sorts and constituted the weakest aspect of the Paris Agreement. Not surprisingly, a coalition of small island nations demanded a "Marshall Plan" for the Pacific. Borrowing the term "Marshall Plan" from the post-World War II reconstruction effort, the coalition of Pacific island nation, which included [Kiribati](#), [Tuvalu](#), [Fiji](#), and the [Marshall Islands](#), called for an initiative that would include investment in renewable energy and shoreline protection, cultural preservation, economic assistance for economies in transition, and a plan for migration and resettlement for these countries as they confront the catastrophic effects of the melting of the Polar ice caps and the concomitant rise in sea level. The precise contours of the initiative remained unknown, unspecified, and a mere exercise in theory at the time of writing. Yet such an initiative would, at some point, have to be addressed, given the realities of climate change and the slow motion calamity unfolding each day for low-lying island nations across the world.

As noted by Vice President Greg Stone of Conservation International, who also functions as an adviser to the government of [Kiribati](#), "Imagine living in a place where you know it's going to go away someday, but you don't know what day that wave's going to come over and wash your home away." He added, "It's a disaster we know is going to happen." Meanwhile, the intervening years promised to be filled with hardship for small island nations, such as [Kiribati](#). Stone explained, "For every inch of sea-level rise, these islands lose 10 feet of their freshwater table to saltwater intrusion," Stone explained. "So it's not just about the day the water finally goes over the island; it's also about the day that there's just not enough water left and everyone has to move off the island." Presaging the future for island nations that could face submersion, Stone said, "If you look ahead 50 years, a country like [Kiribati](#) could become the first aqueous nation.

possibility of migration. That is, they own this big patch of ocean, and they administer it from elsewhere.”

Foreign Minister Minister Tony Debrum of the [Marshall Islands](#) emerged as the champion advocating on behalf of small island nation states and a loose coalition of concerned countries from the Pacific to the Caribbean, but with support from the [United States](#). He addressed the comprehensive concerns of small island nations regarding the weaknesses of the deal, while simultaneously making clear that the Paris Agreement signified hope for the countries most at risk. In a formal statement, Debrum declared: "We have made history today. Emissions targets are still way off track, but this agreement has the tools to ramp up ambition, and brings a spirit of hope that we can rise to this challenge. I can go back home to my people and say we now have a pathway to survival." Debrum highlighted the imperatives of Pacific island nations, saying, "Our High Ambition Coalition was the lightning rod we needed to lift our sights and expectations for a strong agreement here in Paris. We were joined by countries representing more than half the world. We said loud and clear that a bare-bones, minimalist agreement would not fly. We instead demanded an agreement to mark a turning point in history, and the beginning of our journey to the post-carbon era.”

Debrum of the [Marshall Islands](#) espoused the quintessential synopsis of the accord and its effects for those most likely to be affected by climate change as he noted, "Climate change won't stop overnight, and my country is not out of the firing line just yet, but today we all feel a little safer.”

Editor's Note on Kiribati:

Kiribati, once known as the Gilbert Islands, is made up of 33 coral atolls and sits amidst two million square miles of Pacific Ocean. With its highest point only six feet above sea level, [Kiribati](#) has been particularly vulnerable to the rise of sea level as a result of global climate change. In [Kiribati](#), ecological concerns and the climate crisis have also been dominant themes with life and death consequences for the people of [Kiribati](#). Indeed, their very livelihoods of fishing and subsistence farming remain at risk as a result of ecological and environmental changes. Yet even so, [Kiribati](#) is threatened by increasingly high storm surges, which could wipe out entire villages and contaminate water supplies. Moreover, Kiribati's very existence is thus at severe risk of being obliterated from the map. As such, policies have also centered on emergency planning for worst case scenarios in this vulnerable country. Kiribati's government has also concluded that the people will have to choice but to leave the islands and it has called on the international community to assist in this regard. This call has come after years of attempting to draw international attention to the plight of global climate change and its dire consequences for small island states. The case of [Kiribati](#) illuminates the emerging global challenge of environmental refugees.

Environmental Policy

Regulation and Jurisdiction:

The regulation and protection of the environment in Kiribati is under the jurisdiction of the following:

- Ministry of the Environment and Natural Resources Development
- Home Affairs Ministry
- Rural Development Ministry

Major Non-Governmental Organizations:

N/A

International Environmental Accords:

Party to:

- Biodiversity
- Climate Change
- Climate Change-Kyoto Protocol
- Desertification
- Hazardous Wastes
- Law of the Sea
- Marine Dumping
- Ozone Layer Protection
- Whaling

Signed but not ratified:

- None

Global Environmental Snapshot

Introduction

The countries of the world face many environmental challenges in common. Nevertheless, the nature and intensity of problem vary from region to region, as do various countries' respective capacities, in terms of affluence and infrastructure, to remediate threats to environmental quality.

Consciousness of perils affecting the global environment came to the fore in the last third or so of the 20th century has continued to intensify well into the new millennium. According to the United Nations Environment Programme, considerable environmental progress has been made at the level of institutional developments, international cooperation accords, and public participation. Approximately two-dozen international environmental protection accords with global implications have been promulgated since the late 1970s under auspices of the United Nations and other international organizations, together with many additional regional agreements. Attempts to address and rectify environmental problems take the form of legal frameworks, economic instruments, environmentally sound technologies and cleaner production processes as well as conservation efforts. Environmental impact assessments have increasingly been applied across the globe.

Environmental degradation affects the quality, or aesthetics, of human life, but it also displays potential to undermine conditions necessary for the sustainability of human life. Attitudes toward

the importance of environmental protection measures reflect ambivalence derived from this bifurcation. On one hand, steps such as cleaning up pollution, dedicating parkland, and suchlike, are seen as embellishments undertaken by wealthy societies already assured they can successfully perform those functions deemed, ostensibly, more essential-for instance, public health and education, employment and economic development. On the other hand, in poorer countries, activities causing environmental damage-for instance the land degradation effects of unregulated logging, slash-and-burn agriculture, overgrazing, and mining-can seem justified insofar as such activities provide incomes and livelihoods.

Rapid rates of resource depletion are associated with poverty and high population growth, themselves correlated, whereas consumption per capita is much higher in the most developed countries, despite these nations' recent progress in energy efficiency and conservation. It is impossible to sequester the global environmental challenge from related economic, social and political challenges.

First-tier industrialized countries have recently achieved measurable decreases in environmental pollution and the rate of resource depletion, a success not matched in middle income and developing countries. It is believed that the discrepancy is due to the fact that industrialized countries have more developed infrastructures to accommodate changes in environmental policy, to apply environmental technologies, and to invest in public education. The advanced industrialized countries incur relatively lower costs in alleviating environmental problems, in comparison to developing countries, since in the former even extensive environmental programs represent a rather minuscule percentage of total expenditures. Conversely, budget constraints, lagged provision of basic services to the population, and other factors such as debt service and militarization may preclude institution of minimal environmental protection measures in the poorest countries.

A synopsis for the current situation facing each region of the world follows:

Regional Synopsis: Africa

The African continent, the world's second-largest landmass, encompasses many of the world's least developed countries. By global standards, urbanization is comparatively low but rising at a rapid rate. More heavily industrialized areas at the northern and southern ends of the continent experience the major share of industrial pollution. In other regions the most serious environmental problems typically stem from inefficient subsistence farming methods and other forms of land degradation, which have affected an increasingly extensive area under pressure of a widely impoverished, fast-growing population. Africa's distribution of natural resources is very uneven. It is the continent at greatest risk of desertification, especially in the Sahel region at the edge of the Sahara but also in other dry-range areas. Yet at the same time, Africa also harbors some of the earth's richest and most diverse biological zones.

Key Points:

Up to half a billion hectares of African land are moderately to severely degraded, an occurrence reflecting short-fallow shifting cultivation and overgrazing as well as a climatic pattern of recurrent droughts.

Soil degradation is severe along the expanse directly south of the Sahara, from the west to the east coasts. Parts of southern Africa, central-eastern Africa, and the neighboring island of Madagascar suffer from serious soil degradation as well.

Africa contains about 17 percent of the world's forest cover, concentrated in the tropical belt of the continent. Many of the forests, however, are severely depleted, with an estimated 70 percent showing some degree of degradation.

Population growth has resulted in continuing loss of arable land, as inefficient subsistence farming techniques affect increasingly extensive areas. Efforts to implement settled, sustainable agriculture have met with some recent success, but much further progress in this direction is needed. Especially in previously uninhabited forestlands, concern over deforestation is intensifying.

By contrast, the African savanna remains the richest grassland in the world, supporting a substantial concentration of animal and plant life. Wildlife parks are sub-Saharan Africa's greatest tourist attraction, and with proper management-giving local people a stake in conservation and controlling the pace of development-could greatly enhance African economies.

Significant numbers of mammal species in parts of northern, southern and eastern Africa are currently threatened, while the biological diversity in Mauritania and Madagascar is even further compromised with over 20 percent of the mammal species in these two countries currently under threat.

With marine catch trends increasing from 500,000 metric tons in the 1950s to over 3,000,000 metric tons by 2000, there was increasing concern about the reduction in fisheries and marine life, should this trend continue unabated.

Water resource vulnerability is a major concern in northeastern Africa, and a moderate concern across the rest of the continent. An exception is central Africa, which has plentiful water supplies.

Many Africans lack adequate access to resources, not just (if at all) because the resources are unevenly distributed geographically, but also through institutional failures such as faulty land tenure systems or political upheaval. The quality of Africa's natural resources, despite their spotty distribution, is in fact extraordinarily rich. The infrastructure needed to protect and benefit from

this natural legacy, however, is largely lacking.

Regional Synopsis: Asia and the Pacific

Asia-earth's largest landmass-and the many large and nearly innumerable small islands lying off its Pacific shore display extraordinarily contrasting landscapes, levels of development, and degrees of environmental stress. In the classification used here, the world's smallest continent, Australia, is also included in the Asia-Pacific region.

The Asia-Pacific region is home to 9 of the world's 14 largest urban areas, and as energy use for utilities, industry and transport increases in developing economies, urban centers are subject to worsening air quality. Intense population density in places such as Bangladesh or Hong Kong is the quintessential image many people have of Asia, yet vast desert areas such as the Gobi and the world's highest mountain range, the Himalayas, span the continent as well. Forested areas in Southeast Asia and the islands of Indonesia and the Philippines were historically prized for their tropical hardwood, but in many places this resource is now severely depleted. Low-lying small island states are extremely vulnerable to the effects of global warming, both rising sea levels and an anticipated increase in cyclones.

Key Points:

Asian timber reserves are forecast to be depleted in the next 40 years. Loss of natural forest is irreversible in some areas, but plantation programs to restore tree cover may ameliorate a portion of the resulting land degradation.

Increased usage of fossil fuels in China and other parts of southern Asia is projected to result in a marked increase in emissions, especially in regard to carbon dioxide. The increased usage of energy has led to a marked upsurge in air pollution across the region.

Acidification is an emerging problem regionally, with sulfur dioxide emissions expected to triple by 2010 if the current growth rate is sustained. China, Thailand, India, and Korea seem to be suffering from particularly high rates of acid deposition. By contrast, Asia's most highly developed economy, Japan, has effected substantial improvements in its environmental indicators.

Water pollution in the Pacific is an urgent concern since up to 70 percent of the water discharged into the region's waters receives no treatment. Additionally, the disposal of solid wastes, in like manner, poses a major threat in a region with many areas of high population density.

The Asia-Pacific region is the largest expanse of the world's land that is adversely affected by soil degradation.

The region around Australia reportedly suffers the largest degree of ozone depletion.

The microstates of the Pacific suffer land loss due to global warming, and the consequent rise in the levels of ocean waters. A high-emissions scenario and anthropogenic climate impact at the upper end of the currently predicted range would probably force complete evacuation of the lowest-elevation islands sometime in this century.

The species-rich reefs surrounding Southeast Asia are highly vulnerable to the deleterious effects of coastal development, land-based pollution, over-fishing and exploitative fishing methods, as well as marine pollution from oil spills and other activities.

With marine catch trends increasing from 5,000,000 metric tons in the 1950s to over 20,000,000 metric tons by 2000, there was increasing concern about the reduction in fisheries and marine life, should this trend continue unabated.

Significant numbers of mammal species in parts of China and south-east Asia are currently threatened, while the biological diversity in India, Japan, Australia, the Philippines, Indonesia and parts of Malaysia is even further compromised with over 20 percent of the mammal species in these countries currently under threat.

Water resource vulnerability is a serious concern in areas surrounding the Indian subcontinent.

Regional Synopsis: Central Asia

The Central Asian republics, formerly in the Soviet Union, experience a range of environmental problems as the result of poorly executed agricultural, industrial, and nuclear programs during the Soviet era. Relatively low population densities are the norm, especially since upon the breakup of the U.S.S.R. many ethnic Russians migrated back to European Russia. In this largely semi-arid region, drought, water shortages, and soil salinization pose major challenges.

Key Points:

The use of agricultural pesticides, such as DDT and other chemicals, has contributed to the contamination of soil and groundwater throughout the region.

Land and soil degradation, and in particular, increased salinization, is mostly attributable to faulty irrigation practices.

Significant desertification is also a problem in the region.

Air pollution is prevalent, mostly due to use of low octane automobile fuel.

Industrial pollution of the Caspian Sea and the Aral Sea, as a result of industrial effluents as well as mining and metal production, presents a challenge to the countries bordering these bodies of water.

One of the most severe environmental problems in the region is attributable to the several billion tons of hazardous materials stored in landfills across Central Asia.

Uzbekistan's particular problem involves the contraction of the Aral Sea, which has decreased in size by a third, as a consequence of river diversions and poor irrigation practices. The effect has been the near-total biological destruction of that body of water.

Kazakhstan, as a consequence of being the heartland of the former Soviet Union's nuclear program, has incurred a high of cancerous malignancies, biogenetic abnormalities and radioactive contamination.

While part of the Soviet Union, the republics in the region experienced very high levels of greenhouse gas emissions, as a consequence of rapid industrialization using cheap but dirty energy sources, especially coal.

By contrast, however, there have recently been substantial reductions in the level of greenhouse gas emissions, especially those attributable to coal burning, with further decreases anticipated over the next decade. These changes are partially due to the use of cleaner energy technologies, such as natural gas, augmented by governmental commitment to improving environmental standards.

Regional Synopsis: Europe

Western Europe underwent dramatic transformation of its landscape, virtually eliminating large-scale natural areas, during an era of rapid industrialization, which intensified upon its recovery from World War II. In Eastern Europe and European Russia, intensive land development has been less prevalent, so that some native forests and other natural areas remain. Air and water pollution from use of dirty fuels and industrial effluents, however, are more serious environmental problems in Eastern than in Western Europe, though recent trends show improvement in many indicators. Acid rain has inflicted heavy environmental damage across much of Europe, particularly on forests. Europe and North America are the only regions in which water usage for industry exceeds that for agriculture, although in Mediterranean nations agriculture is the largest water consumer.

Key Points:

Europe contributes 36 percent of the world's chlorofluorocarbon emissions, 30 percent of carbon dioxide emissions, and 25 percent of sulfur dioxide emissions.

Sulfur and nitrogen oxide emissions are the cause of 30 to 50 percent of Central and Eastern Europe's deforestation.

Acid rain has been an environmental concern for decades and continues to be a challenge in parts of Western Europe.

Overexploitation of up to 60 percent of Europe's groundwater presents a problem in industrial and urban areas.

With marine catch trends increasing from 5,000,000 metric tons in the 1950s to over 20,000,000 metric tons by 2000, there was increasing concern about the reduction in fisheries and marine life, should this trend continue unabated.

Significant numbers of mammal species in parts of western Europe, Eastern Europe and Russia are currently threatened, while the biological diversity on the Iberian Peninsula is even further compromised with over 40 percent of the mammal species in this region currently under threat. As a result, there has been a 10 percent increase in protected areas of Europe.

A major environmental issue for Europe involves the depletion of various already endangered or threatened species, and most significantly, the decline of fish stocks. Some estimates suggest that up to 50 percent of the continent's fish species may be considered endangered species. Coastal fisheries have been over-harvested, resulting in catch limits or moratoriums on many commercially important fish species.

Fortunately, in the last few years, these policies have started to yield measurable results with decreasing trends in marine fish catch.

Recently, most European countries have adopted cleaner production technologies, and alternative methods of waste disposal, including recycling.

The countries of Eastern Europe have made air quality a major environmental priority. This is exemplified by the Russian Federation's addition to the 1995 "Berlin Mandate" (transnational legislation based on resolutions of the Rio Earth Summit) compelling nations to promote "carbon sinks" to absorb greenhouse gases.

On a relative basis, when compared with the degree of industrial emissions emitted by many Eastern European countries until the late 1980s, there has been some marked increase in air quality in the region, as obsolete plants are closed and a transition to cleaner fuels and more efficient

energy use takes place.

Regional Synopsis: The Middle and Near East

Quite possibly, the Middle East will exemplify the adage that, as the 20th century was a century fixated on oil, the 21st century will be devoted to critical decisions about water. Many (though far from all) nations in the Middle East rank among those countries with the largest oil and gas reserves, but water resources are relatively scarce throughout this predominantly dry region. Effects of global warming may cause moderately high elevation areas that now typically receive winter "snowpack" to experience mainly rain instead, which would further constrain dry-season water availability. The antiquities and religious shrines of the region render it a great magnet for tourism, which entails considerable economic growth potential but also intensifies stresses on the environment.

Key Points:

Water resource vulnerability is a serious concern across the entire region. The increased usage of, and further demand for water, has exacerbated long-standing water scarcity in the region. For instance, river diversions and industrial salt works have caused the Dead Sea to shrink by one-third from its original surface area, with further declines expected.

The oil industry in the region contributes to water pollution in the Persian Gulf, as a result of oil spills, which have averaged 1.2 million barrels of oil spilt per year (some sources suggest that this figure is understated). The consequences are severe because even after oil spills have been cleaned up, environmental damage to the food webs and ecosystems of marine life will persist for a prolonged period.

The region's coastal zone is considered one of the most fragile and endangered ecosystems of the world. Land reclamation, shoreline construction, discharge of industrial effluents, and tourism (such as diving in the Red Sea) contribute to widespread coastal damage.

Significant numbers of mammal species in parts of the Middle East are currently threatened.

Since the 1980s, 11 percent of the region's natural forest has been depleted.

Regional Synopsis: Latin America and the Caribbean

The Latin American and Caribbean region is characterized by exceedingly diverse landforms that

have generally seen high rates of population growth and economic development in recent decades. The percentage of inhabitants residing in urban areas is quite high at 73.4 percent; the region includes the megacities of Mexico City, Sao Paulo, and Rio de Janeiro. The region also includes the world's second-highest mountain range, the Andes; significant expanses of desert and grassland; the coral reefs of the Caribbean Sea; and the world's largest contiguous tropical forest in the Amazon basin. Threats to the latter from subsistence and commercial farming, mineral exploitation and timbering are well publicized. Nevertheless, of eight countries worldwide that still retain at least 70 percent of their original forest cover, six are in Latin America. The region accounts for nearly half (48.3 percent) of the world's greenhouse gas emissions derived from land clearing, but as yet a comparatively minuscule share (4.3 percent) of such gases from industrial sources.

Key Points:

Although Latin America is one of the most biologically diverse regions of the world, this biodiversity is highly threatened, as exemplified by the projected extinction of up to 100,000 species in the next few decades. Much of this loss will be concentrated in the Amazon area, although the western coastline of South America will also suffer significant depletion of biological diversity. The inventory of rainforest species with potentially useful commercial or medical applications is incomplete, but presumed to include significant numbers of such species that may become extinct before they are discovered and identified.

Up to 50 percent of the region's grazing land has lost its soil fertility as a result of soil erosion, salinization, alkalinization and overgrazing.

The Caribbean Sea, the Atlantic Ocean, and the Pacific Ocean have all been contaminated by agricultural wastes, which are discharged into streams that flow into these major waters. Water pollution derived from phosphorous, nitrates and pesticides adversely affects fish stocks, contributes to oxygen depletion and fosters overgrowth of aquatic vegetation. Marine life will continue to be severely compromised as a result of these conditions.

Due to industrial development in the region, many beaches of eastern Latin America and the Caribbean suffer from tar deposits.

Most cities in the region lack adequate sewage treatment facilities, and rapid migration of the rural poor into the cities is widening the gap between current infrastructure capacity and the much greater level needed to provide satisfactory basic services.

The rainforest region of the Amazon Basin suffers from dangerously high levels of deforestation, which may be a significant contributory factor to global warming or "the greenhouse effect." In the late 1990s and into the new millennium, the rate of deforestation was around 20 million acres of rainforest being destroyed annually.

Deforestation on the steep rainforest slopes of Caribbean islands contributes to soil erosion and landslides, both of which then result in heavy sedimentation of nearby river systems. When these sedimented rivers drain into the sea and coral reefs, they poison the coral tissues, which are vital to the maintenance of the reef ecosystem. The result is marine degradation and nutrient depletion. Jamaica's coral reefs have never quite recovered from the effects of marine degradation.

The Southern Cone of Latin America (Argentina, Brazil, Chile, Paraguay, and Uruguay) suffers the effects of greatly increased ultraviolet-B radiation, as a consequence of more intense ozone depletion in the southern hemisphere.

Water resource vulnerability is an increasingly major concern in the northwestern portion of South America.

Regional Synopsis: North America

North American nations, in particular the United States and Canada, rank among the world's most highly developed industrial economies—a fact which has generated significant pollution problems, but also financial resources and skills that have enabled many problems to be corrected. Although efforts to promote energy efficiency, recycling, and suchlike have helped ease strains on the environment in a part of the world where per capita consumption levels are high, sprawling land development patterns and recent preferences many households have demonstrated for larger vehicles have offset these advances.

Meanwhile, a large portion of North America's original forest cover has been lost, though in many cases replaced by productive second-growth woodland. In recent years, attitudes toward best use of the region's remaining natural or scenic areas seem to be shifting toward recreation and preservation and away from resource extraction. With increasing attention on the energy scarcity in the United States, however, there is speculation that this shift may be short-lived. Indeed, the energy shortage on the west coast of the United States and associated calls for energy exploration, indicate a possible retrenchment toward resource extraction. At the same time, however, it has also served to highlight the need for energy conservation as well as alternative energy sources.

Despite generally successful anti-pollution efforts, various parts of the region continue to suffer significant air, water and land degradation from industrial, vehicular, and agricultural emissions and runoff. Mexico, as a middle-income country, displays environmental problems characteristic of a developing economy, including forest depletion, pollution from inefficient industrial processes and dirty fuels, and lack of sufficient waste-treatment infrastructure.

Key Points:

Because of significantly greater motor vehicle usage in the United States (U.S.) than in the rest of the world, the U.S. contribution of urban air pollution and greenhouse gas emissions, especially carbon dioxide, is disproportionately high in relation to its population.

Acid rain is an enduring issue of contention in the northeastern part of the United States, on the border with Canada.

Mexico's urban areas suffer extreme air pollution from carbon monoxide, nitrogen oxides, sulfur dioxide, and other toxic air pollutants. Emissions controls on vehicles are in their infancy, compared to analogous regulations in the U.S.

The cities of Mexico, including those on the U.S. border, also discharge large quantities of untreated or poorly treated sewage, though officials are currently planning infrastructure upgrades.

Deforestation is noteworthy in various regions of the U.S., especially along the northwest coastline. Old growth forests have been largely removed, but in the northeastern and upper midwestern sections of the United States, evidence suggests that the current extent of tree cover probably surpasses the figure for the beginning of the 20th century.

Extreme weather conditions in the last few years have resulted in a high level of soil erosion along the north coast of California; in addition, the coastline itself has shifted substantially due to soil erosion and concomitant landslides.

Agricultural pollution-including nitrate contamination of well water, nutrient runoff to waterways, and pesticide exposure-is significant in various areas. Noteworthy among affected places are California's Central Valley, extensive stretches of the Midwest, and land in the Chesapeake Bay watershed.

Inland waterways, especially around the Great Lakes, have substantially improved their water quality, due to concentrated efforts at reducing water pollution by governmental, commercial and community representatives. Strict curbs on industrial effluents and near-universal implementation of sewage treatment are the chief factors responsible for this improvement.

A major environmental issue for Canada and the United States involves the depletion of various already endangered or threatened species, and most significantly, the decline of fish stocks. Coastal fisheries have been over-harvested, resulting in catch limits or moratoriums on many commercially important fish species. In the last few years, these policies have started to yield measurable results with decreasing trends in marine fish catch.

Due to the decay of neighboring ecosystems in Central America and the Caribbean, the sea

surrounding Florida has become increasingly sedimented, contributing to marine degradation, nutrient depletion of the ecosystem, depletion of fish stocks, and diseases to coral species in particular.

Polar Regions

Key Points:

The significant rise in sea level, amounting 10 to 25 centimeters in the last 100 years, is due to the melting of the Arctic ice sheets, and is attributed to global warming.

The Antarctic suffers from a significant ozone hole, first detected in 1976. By 1985, a British scientific team reported a 40 percent decrease in usual regeneration rates of the ozone. Because a sustained increase in the amount of ultraviolet-B radiation would have adverse consequences upon all planetary life, recent environmental measures have been put into effect, aimed at reversing ozone depletion. These measures are projected to garner significant results by 2050.

Due to air and ocean currents, the Arctic is a sink for toxic releases originally discharged thousands of miles away. Arctic wildlife and Canada's Inuit population have higher bodily levels of contaminants such as PCB and dioxin than those found in people and animals in much of the rest of the world.

Global Environmental Concepts

-

1. Global Warming and Greenhouse Gases

The Greenhouse Effect:

In the early 19th century, the French physicist, Jean Fourier, contended that the earth's atmosphere functions in much the same way as the glass of a greenhouse, thus describing what is now understood as the "greenhouse effect." Put simply, the "greenhouse effect" confines some of the sun's energy to the earth, preserving some of the planet's warmth, rather than allowing it to flow back into space. In so doing, all kinds of life forms can flourish on earth. Thus, the "greenhouse effect" is necessary to sustain and preserve life forms and ecosystems on earth.

In the late 19th century, a Swedish chemist, Svante Arrhenius, noticed that human activities, such as the burning of coal and other fossil fuels for heat, and the removal of forested lands for urban development, led to higher concentrations of greenhouse gases, like carbon dioxide and methane, in the atmosphere. This increase in the levels of greenhouse gases was believed to advance the "greenhouse effect" exponentially, and might be related to the trend in global warming.

In the wake of the Industrial Revolution, after industrial development took place on a large scale and the total human population burgeoned simultaneously with industrialization, the resulting increase in greenhouse gas emissions could, many scientists believe, be significant enough to have some bearing on climate. Indeed, many studies in recent years support the idea that there is a linkage between human activities and global warming, although there is less consensus on the extent to which this linkage may be relevant to environmental concerns.

That said, some scientists have argued that temperature fluctuations have existed throughout the evolution of the planet. Indeed, Dr. S. Fred Singer, the president of the Science and Environment Policy Project has noted that 3,000-year-old geological records of ocean sediment reveal changes in the surface temperature of the ocean. Hence, it is possible that climate variability is merely a normal fact of the planet's evolution. Yet even skeptics as to anthropogenic factors concur that any substantial changes in global temperatures would likely have an effect upon the earth's ecosystems, as well as the life forms that inhabit them.

The Relationship Between Global Warming and Greenhouse Gases:

A large number of climatologists believe that the increase in atmospheric concentrations of "greenhouse gas emissions," mostly a consequence of human activities such as the burning of fossil fuels, are contributing to global warming. The cause notwithstanding, the planet has reportedly warmed 0.3°C to 0.6°C over the last century. Indeed, each year during the 1990s was one of the very warmest in the 20th century, with the mean surface temperature for 1999 being the fifth warmest on record since 1880.

In early 2000, a panel of atmospheric scientists for the National Research Council concluded in a report that global warming was, indeed, a reality. While the panel, headed by Chairman John Wallace, a professor of atmospheric sciences at the University of Washington, stated that it remained unclear whether human activities have contributed to the earth's increasing temperatures, it was apparent that global warming exists.

In 2001, following a request for further study by the incoming Bush administration in the [United States](#), the National Academy of Sciences again confirmed that global warming had been in existence for the last 20 years. The study also projected an increase in temperature between 2.5 degrees and 10.4 degrees Fahrenheit by the year 2100. Furthermore, the study found the leading

cause of global warming to be emissions of carbon dioxide from the burning of fossil fuels, and it noted that greenhouse gas accumulations in the earth's atmosphere was a result of human activities.

Within the scientific community, the controversy regarding has centered on the difference between surface air and upper air temperatures. Information collected since 1979 suggests that while the earth's surface temperature has increased by about a degree in the past century, the atmospheric temperature five miles above the earth's surface has indicated very little increase. Nevertheless, the panel stated that this discrepancy in temperature between surface and upper air does not invalidate the conclusion that global warming is taking place. Further, the panel noted that natural events, such as volcanic eruptions, can decrease the temperature in the upper atmosphere.

The major consequences of global warming potentially include the melting of the polar ice caps, which, in turn, contribute to the rise in sea levels. Many islands across the globe have already experienced a measurable loss of land as a result. Because global warming may increase the rate of evaporation, increased precipitation, in the form of stronger and more frequent storm systems, is another potential outcome. Other consequences of global warming may include the introduction and proliferation of new infectious diseases, loss of arable land (referred to as "desertification"), destructive changes to existing ecosystems, loss of biodiversity and the isolation of species, and concomitant adverse changes in the quality of human life.

International Policy Development in Regard to Global Warming:

Regardless of what the precise nature of the relationship between greenhouse gas emissions and global warming may be, it seems that there is some degree of a connection between the phenomena. Any substantial reductions in greenhouse gas emissions and global warming trends will likely involve systematic changes in industrial operations, the use of advanced energy sources and technologies, as well as global cooperation in implementing and regulating these transformations.

In this regard, the United Nations Framework Convention on Climate Change (UNFCCC) stipulated the following objectives:

1. To stabilize "greenhouse gas" concentrations within the atmosphere, in such a manner that would preclude hazardous anthropogenic intervention into the existing biosphere and ecosystems of the world. This stabilization process would facilitate the natural adaptation of ecosystems to changes in climate.
2. To ensure and enable sustainable development and food production on a global scale.

*** See section on "International Environmental Agreements and Associations" for information related to international policies related to limiting greenhouse gases and controlling climate change

emanating from historic summits at Kyoto, Copenhagen, Doha, and Paris. ***

2. Air Pollution

Long before global warming reared its head as a significant issue, those concerned about the environment and public health noted the deleterious effects of human-initiated combustion upon the atmosphere. Killer smogs from coal burning triggered acute health emergencies in London and other places. At a lower level of intensity motor vehicle, power plant, and industrial emissions impaired long-range visibility and probably had some chronic adverse consequences on the respiratory systems of persons breathing such air.

In time, scientists began associating the sulfur dioxide and nitrogen oxides released from coal burning with significant acid deposition in the atmosphere, eventually falling as "acid rain." This phenomenon has severely degraded forestlands, especially in Europe and a few parts of the [United States](#). It has also impaired some aquatic ecosystems and eaten away the surface of some human artifacts, such as marble monuments. Scrubber technology and conversion to cleaner fuels have enabled the level of industrial production to remain at least constant while significantly reducing acid deposition. Technologies aimed at cleaning the air and curtailing acid rain, soot, and smog may, nonetheless, boomerang as the perils of global warming become increasingly serious. In brief, these particulates act as sort of a sun shade -- comparable to the effect of volcanic eruptions on the upper atmosphere whereby periods of active volcanism correlate with temporarily cooler weather conditions. Thus, while the carbon dioxide releases that are an inevitable byproduct of combustion continue, by scrubbing the atmosphere of pollutants, an industrial society opens itself to greater insolation (penetration of the sun's rays and consequent heating), and consequently, it is likely to experience a correspondingly greater rise in ambient temperatures.

The health benefits of removing the sources of acid rain and smog are indisputable, and no one would recommend a return to previous conditions. Nevertheless, the problematic climatic effects of continually increasing emissions of carbon dioxide and other greenhouse gases pose a major global environmental challenge, not as yet addressed adequately.

3. Ozone Depletion

The stratospheric ozone layer functions to prevent ultraviolet radiation from reaching the earth. Normally, stratospheric ozone is systematically disintegrated and regenerated through natural photochemical processes. The stratospheric ozone layer, however, has been depleted unnaturally as a result of anthropogenic (man-made) chemicals, most especially chlorine and bromide compounds such as chloroflorocarbons (CFCs), halons, and various industrial chemicals in the form of

solvents, refrigerants, foaming agents, aerosol propellants, fire retardants, and fumigants. Ozone depletion is of concern because it permits a greater degree of ultraviolet-B radiation to reach the earth, which then increases the incidences of cancerous malignancies, cataracts, and human immune deficiencies. In addition, even in small doses, ozone depletion affects the ecosystem by disturbing food chains, agriculture, fisheries and other forms of biological diversity.

Transnational policies enacted to respond to the dangers of ozone depletion include the 1985 Vienna Convention on the Protection of the Ozone Layer and the 1987 Montreal Protocol on Substances that Deplete the Ozone Layer. The Montreal Protocol was subsequently amended in London in 1990, Copenhagen in 1992 and Vienna in 1995. By 1996, 155 countries had ratified the Montreal Protocol, which sets out a time schedule for the reduction (and eventual elimination) of ozone depleting substances (OPS), and bans exports and imports of ODS from and to non-participant countries.

In general, the Protocol stipulates that developed countries must eliminate halon consumption by 1994 and CFC consumption by 1996, while developing countries must eliminate these substances by 2010. Consumption of methyl bromide, which is used as a fumigant, was to be frozen at the 1995 in developed countries, and fully eliminated in 2010, while developing countries are to freeze consumption by 2002, based on average 1995-1998 consumption levels. Methyl chloroform is to be phased out by 2005. Under the Montreal Protocol, most ODS will be completely eliminated from use by 2010.

4. Land Degradation

In recent decades, land degradation in more arid regions of the world has become a serious concern. The problem, manifest as both "desertification" and "devegetation," is caused primarily by climate variability and human activities, such as "deforestation," excessive cultivation, overgrazing, and other forms of land resource exploitation. It is also exacerbated by inadequate irrigation practices. Although the effects of droughts on drylands have been temporary in the past, today, the productivity and sustainability of these lands have been severely compromised for the long term. Indeed, in every region of the world, land degradation has become an acute issue.

Desertification and Devegetation:

"Desertification" is a process of land degradation causing the soil to deteriorate, thus losing its nutrients and fertility, and eventually resulting in the loss of vegetation, known as "devegetation." As aforementioned, "desertification" and "devegetation" are caused by human activities, yet human beings are also the greatest casualties. Because these forms of land degradation affect the ability of the soil to produce crops, they concomitantly contribute to poverty. As population increases and

demographic concentrations shift, the extent of land subject to stresses by those seeking to wrest subsistence from it has inexorably risen.

In response, the United Nations has formed the Convention to Combat Desertification-aimed at implementing programs to address the underlying causes of desertification, as well as measures to prevent and minimize its effects. Of particular significance is the formulation of policies on transboundary resources, such as areas around lakes and rivers. At a broader level, the Convention has established a Conference of Parties (COP), which includes all ratifying governments, for directing and advancing international action.

To ensure more efficacious use of funding, the Convention intends to reconfigure international aid to utilize a consultative and coordinated approach in the disbursement and expenditure of donor funds. In this way, local communities that are affected by desertification will be active participants in the solution-generation process. In-depth community education projects are envisioned as part of this new international aid program, and private donor financing is encouraged. Meanwhile, as new technologies are developed to deal with the problem of desertification, they need to be distributed for application across the world. Hence, the Convention calls for international cooperation in scientific research in this regard.

Desertification is a problem of sustainable development. It is directly connected to human challenges such as poverty, social and economic well-being and environmental protection as well. Broader environmental issues, such as climate change, biological diversity, and freshwater supplies, are indirectly related, so any effort to resolve this environmental challenge must entail coordinated research efforts and joint action.

Deforestation:

Deforestation is not a recent phenomenon. For centuries, human beings have cut down trees to clear space for land cultivation, or in order to use the wood for fuel. Over the last 200 years, and most especially after World War II, deforestation increased because the logging industry became a globally profitable endeavor, and so the clearing of forested areas was accelerated for the purposes of industrial development. In the long term, this intensified level of deforestation is considered problematic because the forest is unable to regenerate itself quickly. The deforestation that has occurred in tropical rainforests is seen as an especially serious concern, due to the perceived adverse effects of this process upon the entire global ecosystem.

The most immediate consequence of deforestation is soil degradation. Soil, which is necessary for the growth of vegetation, can be a fragile and vital property. Organically, an extensive evolution process must take place before soil can produce vegetation, yet at the same time, the effects of natural elements, such as wind and rain, can easily and quickly degrade this resource. This

phenomenon is known as soil erosion. In addition, natural elements like wind and rain reduce the amount of fertile soil on the ground, making soil scarcity a genuine problem. When fertile topsoil that already exists is removed from the landscape in the process of deforestation, soil scarcity is further exacerbated. Equally significant is the fact that once land has been cleared so that the topsoil can be cultivated for crop production, not only are the nutrient reserves in the soil depleted, thus producing crops of inferior quality, but the soil structure itself becomes stressed and deteriorates further.

Another direct result of deforestation is flooding. When forests are cleared, removing the cover of vegetation, and rainfall occurs, the flow of water increases across the surface of land. When extensive water runoff takes place, the frequency and intensity of flooding increases. Other adverse effects of deforestation include the loss of wildlife and biodiversity within the ecosystem that supports such life forms.

At a broader level, tropical rainforests play a vital role in maintaining the global environmental system. Specifically, destruction of tropical rainforests affects the carbon dioxide cycle. When forests are destroyed by burning (or rotting), carbon dioxide is released into the air, thus contributing to an intensified "greenhouse effect." The increase in greenhouse gas emissions like carbon dioxide is a major contributor to global warming, according to many environmental scientists. Indeed, trees themselves absorb carbon dioxide in the process of photosynthesis, so their loss also reduces the absorption of greenhouse gases.

Tropical rainforest destruction also adversely affects the nitrogen cycle. Nitrogen is a key nutrient for both plants and animals. Plants derive nitrogen from soil, while animals obtain it via nitrogen-enriched vegetation. This element is essential for the formation of amino acids, and thereby for proteins and biochemicals that all living things need for metabolism and growth. In the nitrogen cycle, vegetation acquires these essential proteins and biochemicals, and then cyclically returns them to the atmosphere and global ecosystem. Accordingly, when tropical rainforest ecosystems are compromised, not only is vegetation removed; the atmosphere is also affected and climates are altered. At a more immediate level, the biodiversity within tropical rainforests, including wildlife and insect species and a wealth of plant varieties, is depleted. Loss of rare plants is of particular concern because certain species as yet unknown and unused could likely yield many practical benefits, for instance as medicines.

As a result of the many challenges associated with deforestation, many environmental groups and agencies have argued for government policies on the sustainable development of forests by governments across the globe. While many countries have instituted national policies and programs aimed at reducing deforestation, and substantial research has been advanced in regard to sustainable and regenerative forestry development, there has been very little progress on an international level. Generally speaking, most tropical rainforests are located in developing and less developed countries, where economic growth is often dependent upon the exploitation of tropical

rainforests. Timber resources as well as wildlife hunting tend to be particularly lucrative arenas.

In places such as the Amazon, where deforestation takes place for the construction of energy plants aimed at industrialization and economic development, there is an exacerbated effect on the environment. After forests are cleared in order to construct such projects, massive flooding usually ensues. The remaining trees then rot and decay in the wake of the flooding. As the trees deteriorate, their biochemical makeup becomes more acidic, producing poisonous substances such as hydrogen sulphide and methane gases. Acidified water subsequently corrodes the mechanical equipment and operations of the plants, which are already clogged by rotting wood after the floodwaters rise.

Deforestation generally arises from an economically plausible short-term motivation, but nonetheless poses a serious global concern because the effects go beyond national boundaries. The United Nations has established the World Commission on Forest and Sustainable Development. This body's task is to determine the optimal means of dealing with the issue of deforestation, without unduly affecting normal economic development, while emphasizing the global significance of protecting tropical forest ecosystems.

5. Water Resources

For all terrestrial fauna, including humans, water is the most immediate necessity to sustain life. As the population has increased and altered an ever-greater portion of the landscape from its natural condition, demand on water resources has intensified, especially with the development of industrialization and large-scale irrigation. The supply of freshwater is inherently limited, and moreover distributed unevenly across the earth's landmasses. Moreover, not just demand for freshwater but activities certain to degrade it are becoming more pervasive. By contrast, the oceans form a sort of "last wilderness," still little explored and in large part not seriously affected by human activity. However, coastal environments - the biologically richest part of the marine ecosystem-are experiencing major depletion due to human encroachment and over-exploitation.

Freshwater:

In various regions, for instance the Colorado River in the western [United States](#), current withdrawals of river water for irrigation, domestic, and industrial use consume the entire streamflow so that almost no water flows into the sea at the river's mouth. Yet development is ongoing in many such places, implying continually rising demand for water. In some areas reliant on groundwater, aquifers are being depleted at a markedly faster rate than they are being replenished. An example is the San Joaquin Valley in California, where decades of high water withdrawals for agriculture have caused land subsidence of ten meters or more in some spots.

Naturally, the uncertainty of future water supplies is particularly acute in arid and semi-arid regions. Speculation that the phenomenon of global warming will alter geographic and seasonal rainfall patterns adds further uncertainty.

Water conservation measures have great potential to alleviate supply shortages. Some city water systems are so old and beset with leaking pipes that they lose as much water as they meter. Broad-scale irrigation could be replaced by drip-type irrigation, actually enhancing the sustainability of agriculture. In many areas where heavy irrigation has been used for decades, the result is deposition of salts and other chemicals in the soil such that the land becomes unproductive for farming and must be abandoned.

Farming is a major source of water pollution. Whereas restrictions on industrial effluents and other "point sources" are relatively easy to implement, comparable measures to reform hydraulic practices at farms and other "nonpoint sources" pose a significantly knottier challenge. Farm-caused water pollution takes the following main forms:

- Nitrate pollution found in wells in intensive farming areas as a consequence of heavy fertilizer use is a threat to human health. The most serious danger is to infants, who by ingesting high-nitrate water can contract methemoglobinemia, sometimes called "blue baby syndrome," a potentially fatal condition.
- Fertilizer runoff into rivers and lakes imparts unwanted nutrients that cause algae growth and eventual loss of oxygen in the body of water, degrading its ability to support fish and other desirable aquatic life.
- Toxic agricultural chemicals - insecticides, herbicides, and fungicides - are detectable in some aquifers and waterways.

In general, it is much easier to get a pollutant into water than to retrieve it out. Gasoline additives, dry cleaning chemicals, other industrial toxins, and in a few areas radionuclides have all been found in water sources intended for human use. The complexity and long time scale of subterranean hydrological movements essentially assures that pollutants already deposited in aquifers will continue to turn up for decades to come. Sophisticated water treatment processes are available, albeit expensive, to reclaim degraded water and render it fit for human consumption. Yet source protection is unquestionably a more desirable alternative.

In much of the developing world, and even some low-income rural enclaves of the developed world, the population lacks ready access to safe water. Surface water and shallow groundwater supplies are susceptible to contamination from untreated wastewater and failing septic tanks, as well as chemical hazards. The occurrence of waterborne disease is almost certainly greatly underreported.

Marine Resources:

Coastal areas have always been desirable places for human habitation, and population pressure on them continues to increase. Many types of water degradation that affect lakes and rivers also affect coastal zones: industrial effluents, untreated or partially treated sewage, nutrient load from agriculture figure prominently in both cases. Prospects for more extreme storms as a result of global warming, as well as the pervasiveness of poorly planned development in many coastal areas, forebode that catastrophic hurricanes and landslides may increase in frequency in the future. Ongoing rise in sea levels will force remedial measures and in some cases abandonment of currently valuable coastal property.

Fisheries over much of the globe have been overharvested, and immediate conservation measures are required to preserve stocks of many species. Many governments subsidized factory-scale fishing fleets in the 1970s and 1980s, and the resultant catch increase evidently surpassed a sustainable level. It is uncertain how much of the current decline in fish stocks stems from overharvesting and how much from environmental pollution. The deep ocean remains relatively unaffected by human activity, but continental shelves near coastlines are frequently seriously polluted, and these close-to-shore areas are the major biological nurseries for food fish and the smaller organisms they feed on.

6. Environmental Toxins

Toxic chemical pollution exploded on the public consciousness with disclosure of spectacularly polluted industrial areas such as Love Canal near Buffalo, New York. There is no question that pollutants such as organophosphates or radionuclides can be highly deleterious to health, but evidence to date suggests that seriously affected areas are a localized rather than universal problem.

While some explore the possibilities for a lifestyle that fully eschews use of modern industrial chemicals, the most prevalent remediative approach is to focus on more judicious use. The most efficient chemical plants are now able to contain nearly all toxic byproducts of their production processes within the premises, minimizing the release of such substances into the environment. Techniques such as Integrated Pest Management (IPM) dictate limited rather than broadcast use of pesticides: application only when needed using the safest available chemical, supplemented as much as possible with nontoxic controls.

While heightened public awareness and growing technical sophistication suggest a hopeful outlook on limiting the damage from manmade environmental toxins, one must grant that previous incidents of their misuse and mishandling have already caused environmental damage that will have to be

dealt with for many years to come. In the case of the most hazardous radioactive substances, the time scale for successful remediation actually extends beyond that of the recorded history of civilization. Moreover, in this era of high population density and rapid economic growth, quotidian activities such as the transport of chemicals will occasionally, seemingly inevitably result in accidents with adverse environmental consequences.

7. "Islandization" and Biodiversity

With increased awareness regarding the adverse effects of unregulated hunting and habitat depletion upon wildlife species and other aspects of biodiversity, large-scale efforts across the globe have been initiated to reduce and even reverse this trend.

In every region of the world, many species of wildlife and areas of biodiversity have been saved from extinction. Nationally, many countries have adopted policies aimed at preservation and conservation of species, and one of the most tangible measures has been the proliferation of protected habitats. Such habitats exist in the form of wildlife reserves, marine life reserves, and other such areas where biodiversity can be protected from external encroachment and exploitation.

Despite these advances in wildlife and biodiversity protection, further and perhaps more intractable challenges linger. Designated reserves, while intended to prevent further species decline, exist as closed territories, fragmented from other such enclaves and disconnected from the larger ecosystem. This environmental scenario is referred to as "islandization." Habitat reserves often serve as oversized zoos or game farms, with landscapes and wildlife that have effectively been "tamed" to suit. Meanwhile, the larger surrounding ecosystem continues to be seriously degraded and transformed, while within the islandized habitat, species that are the focus of conservation efforts may not have sufficient range and may not be able to maintain healthy genetic variability.

As a consequence, many conservationists and preservationists have demanded that substantially larger portions of land be withheld as habitat reserves, and a network of biological corridors to connect continental reserves be established. While such efforts to combat islandization have considerable support in the [United States](#), how precisely such a program would be instituted, especially across national boundaries, remains a matter of debate. International conservationists and preservationists say without a network of reserves a massive loss of biodiversity will result.

The concept of islandization illustrates why conservation and preservation of wildlife and biodiversity must consider and adopt new, broader strategies. In the past, conservation and preservation efforts have been aimed at specific species, such as the spotted owl and grizzly bear in North America, the Bengal tiger in Southeast Asia, the panda in [China](#), elephants in Africa. Instead, the new approach is to simultaneously protect many and varied species that inhabit the same ecosystem. This method, referred to as "bio-regional conservation," may more efficaciously

generate longer-term and more far-reaching results precisely because it is aimed at preserving entire ecosystems, and all the living things within.

More About Biodiversity Issues:

This section is directly taken from the United Nations Environmental Program: "[Biodiversity Assessment](#)"

The Global Biodiversity Assessment, completed by 1500 scientists under the auspices of United Nations Environmental Program in 1995, updated what is known (or unknown) about global biological diversity at the ecosystem, species and genetic levels. The assessment was uncertain of the total number of species on Earth within an order of magnitude. Of its working figure of 13 million species, only 13 percent are scientifically described. Ecological community diversity is also poorly known, as is its relationship to biological diversity, and genetic diversity has been studied for only a small number of species. The effects of human activities on biodiversity have increased so greatly that the rate of species extinctions is rising to hundreds or thousands of times the background level. These losses are driven by increasing demands on species and their habitats, and by the failure of current market systems to value biodiversity adequately. The Assessment calls for urgent action to reverse these trends.

There has been a new recognition of the importance of protecting marine and aquatic biodiversity. The first quantitative estimates of species losses due to growing coral reef destruction predict that almost 200,000 species, or one in five presently contributing to coral reef biodiversity, could die out in the next 40 years if human pressures on reefs continue to increase.

Since Rio, many countries have improved their understanding of the status and importance of their biodiversity, particularly through biodiversity country studies such as those prepared under the auspices of UNEP/GEF. The [United Kingdom](#) identified 1250 species needing monitoring, of which 400 require action plans to ensure their survival. Protective measures for biodiversity, such as legislation to protect species, can prove effective. In the USA, almost 40 percent of the plants and animals protected under the Endangered Species Act are now stable or improving as a direct result of recovery efforts. Some African countries have joined efforts to protect threatened species through the 1994 Lusaka Agreement, and more highly migratory species are being protected by specialized cooperative agreements among range states under the Bonn Agreement.

There is an emerging realization that a major part of conservation of biological diversity must take place outside of protected areas and involve local communities. The extensive agricultural areas occupied by small farmers contain much biodiversity that is important for sustainable food production. Indigenous agricultural practices have been and continue to be important elements in the maintenance of biodiversity, but these are being displaced and lost. There is a new focus on the

interrelationship between agrodiversity conservation and sustainable use and development practices in smallholder agriculture, with emphasis on use of farmers' knowledge and skills as a source of information for sustainable farming.

Perhaps even more important than the loss of biodiversity is the transformation of global biogeochemical cycles, the reduction in the total world biomass, and the decrease in the biological productivity of the planet. While quantitative measurements are not available, the eventual economic and social consequences may be so significant that the issue requires further attention.

International Environmental Agreements and Associations

International Policy Development in Regard to Global Warming:

Introduction

Regardless of what the precise nature of the relationship between greenhouse gas emissions and

global warming may be, it seems that there is some degree of a connection between the phenomena. Any substantial reductions in greenhouse gas emissions and global warming trends will likely involve systematic changes in industrial operations, the use of advanced energy sources and technologies, as well as global cooperation in implementing and regulating these transformations.

In this regard, the United Nations Framework Convention on Climate Change (UNFCCC) stipulated the following objectives:

1. To stabilize "greenhouse gas" concentrations within the atmosphere, in such a manner that would preclude hazardous anthropogenic intervention into the existing biosphere and ecosystems of the world. This stabilization process would facilitate the natural adaptation of ecosystems to changes in climate.
2. To ensure and enable sustainable development and food production on a global scale.

Following are two discussions regarding international policies on the environment, followed by listings of international accords.

Special Entry: The Kyoto Protocol

The UNFCCC was adopted at the Rio Earth Summit in 1992, and entered into force in 1994. Over 175 parties were official participants.

Meanwhile, however, many of the larger, more industrialized nations failed to reach the emissions' reduction targets, and many UNFCCC members agreed that the voluntary approach to reducing emissions had not been successful. As such, UNFCCC members reached a consensus that legally binding limits were necessitated, and agreed to discuss such a legal paradigm at a meeting in Kyoto, [Japan](#) in 1997. At that meeting, the UNFCCC forged the Kyoto Protocol. This concord is the first legally binding international agreement that places limits on emissions from industrialized countries. The major greenhouse gas emissions addressed in the Kyoto Protocol include carbon dioxide, nitrous oxide, hydrofluorocarbons, perfluorocarbons, sulfur hexafluoride, and methane.

The provisions of the Kyoto Protocol stipulate that economically advanced nations must reduce their combined emissions of greenhouse gases, by approximately five percent from their 1990 levels, before the 2008-2010 deadline. Countries with the highest carbon dioxide emissions, such as the [United States](#) (U.S.), many of the European Union (EU) countries, and [Japan](#), are to reduce emissions by a scale of 6 to 8 percent. All economically advanced nations must show "demonstrable progress" by 2005. In contrast, no binding limits or timetable have been set on developing countries. Presumably, this distinction is due to the fact that most developing countries - - with the obvious exceptions of [India](#) and [China](#) -- simply do not emit as many greenhouse gases

as do more industrially advanced countries. Meanwhile, these countries are entrenched in the process of economic development.

Regardless of the aforementioned reasoning, there has been strong opposition against the asymmetrical treatment assigned to emissions limits among developed and developing countries. Although this distinction might be regarded as unfair in principle, associations such as the Alliance of Small Island States have been vocal in expressing how global warming -- a result of greenhouse gas emissions - has contributed to the rise in sea level, and thus deleteriously affected their very existence as island nation states. For this reason, some parties have suggested that economically advanced nations, upon returning to their 1990 levels, should be required to further reduce their greenhouse gas emissions by a deadline of 2005. In response, interested parties have observed that even if such reductions were undertaken by economically advanced nations, they would not be enough to completely control global warming. Indeed, a reduction in the rate of fossil fuel usage by developing nations would also be necessary to have substantial ameliorative effect on global warming. Indeed, a reduction in the rate of fossil fuel usage by developing nations would also be necessary to have substantial ameliorative effect on global warming.

As such, the Protocol established a "Clean Development Mechanism" which permits developed countries to invest in projects aimed at reducing emissions within developing countries in return for credit for the reductions. Ostensibly, the objective of this mechanism is to curtail emissions in developing countries without unduly penalizing them for their economic development. Under this model, the countries with more potential emissions credits could sell them to other signatories of the Kyoto Protocol, whose emissions are forecast to significantly rise in the next few years. Should this trading of emissions credits take place, it is estimated that the Kyoto Protocol's emissions targets could still be met.

In 1999, the International Energy Outlook projected that Eastern Europe, the former Soviet Union and Newly Independent States, as well as parts of Asia, are all expected to show a marked decrease in their level of energy-related carbon emissions in 2010. Nations with the highest emissions, specifically, the U.S., the EU and [Japan](#), are anticipated to reduce their emissions by up to 8 percent by 2012. By 2000, however, the emissions targets were not on schedule for achievement. Indeed, the U.S. Department of Energy estimates forecast that by 2010, there will be a 34 percent increase in carbon emissions from the 1990 levels, in the absence of major shifts in policy, economic growth, energy prices, and consumer trends. Despite this assessment in the U.S., international support for the Kyoto Protocol remained strong, especially among European countries and island states, who view the pact as one step in the direction away from reliance on fossil fuels and other sources of greenhouse gases.

In 2001, U.S. President, George W. Bush, rejected his country's participation in the Kyoto Protocol, saying that the costs imposed on the global economic system, and especially, on the US, overshadowed the benefits of the Protocol. He also cited the unfair burden on developed nations to

reduce emissions, as another primary reasons for withdrawal from the international pact, as well as insufficient evidence regarding the science of global warming. Faced with impassioned international disapproval for his position, the U.S. president stated that his administration remained interested in dealing with the matter of global warming, but would endorse alternative measures to combat the problem, such as voluntary initiatives limiting emissions. Critics of Bush's position, however, have noted that it was the failure of voluntary initiatives to reduce emissions following the Rio Summit that led to the establishment of the Kyoto Protocol in the first place.

In the wake of the Bush administration's decision, many participant countries resigned themselves to the reality that the goals of the Kyoto Protocol might not be achieved without U.S. involvement. Nevertheless, in Bonn, [Germany](#), in July 2001, the remaining participant countries struck a political compromise on some of the key issues and sticking points, and planned to move forward with the Protocol, irrespective of the absence of the U.S. The key compromise points included the provision for countries to offset their targets with carbon sinks (these are areas of forest and farmland which can absorb carbon through the process of photosynthesis). Another compromise point within the broader Bonn Agreement was the reduction of emissions cuts of six gases from over 5 percent to a more achievable 2 percent. A third key change was the provision of funding for less wealthy countries to adopt more progressive technologies.

In late October and early November 2001, the UNFCCC's 7th Conference of the Parties met in Marrakesh, [Morocco](#), to finalize the measures needed to make the Kyoto Protocol operational. Although the UNFCCC projected that ratification of the Protocol would make it legally binding within a year, many critics noted that the process had fallen short of implementing significant changes in policy that would be necessary to actually stop or even slow climate change. They also maintained that the absence of U.S. participation effectively rendered the Protocol into being a political exercise without any substance, either in terms of transnational policy or in terms of environmental concerns.

The adoption of the compromises ensconced within the Bonn Agreement had been intended to make the provisions of the Kyoto Protocol more palatable to the U.S. In this regard, it failed to achieve its objective as the Bush administration continued to eschew participation in the international accord. Still, however, the Bonn Agreement did manage to render a number of other positive outcomes. Specifically, in 2002, key countries, such as [Russia](#), [Japan](#) and [Canada](#) agreed to ratify the protocol, bringing the number of signatories to 178. The decision by key countries to ratify the protocol was regarded as "the kiss of life" by observers.

By 2005, on the eve of a climate change conference in London, British Prime Minister Tony Blair was hoping to deal with the problems of climate change beyond the provisions set forth in the Kyoto Protocol. Acknowledging that the Kyoto Protocol could not work in its current form, Blair wanted to open the discussion for a new climate change plan.

Blair said that although most of the world had signed on to Kyoto, the protocol could not meet any of its practical goals of cutting greenhouse gas emissions without the participation of the United States, the world's largest polluter. He also noted that any new agreement would have to include India and China -- significant producers of greenhouse gas emissions, but exempt from Kyoto because they have been classified as developing countries. Still, he said that progress on dealing with climate change had been stymied by "a reluctance to face up to reality and the practical action needed to tackle problem."

Blair also touted the "huge opportunities" in technology and pointed toward the possibilities offered by wind, solar and nuclear power, along with fuel cell technology, eco-friendly biofuels, and carbon capture and storage which could generate low carbon power. Blair also asserted that his government was committed to achieving its domestic goal of reducing carbon dioxide emissions by 20 percent by 2010.

In the United States, President George W. Bush has said that global warming remained a debatable issue and despite conclusions reached by his own Environmental Protection Agency, he has not agreed with the conclusion that global warming and climate change are linked with human activities. Bush has also refused to ratify Kyoto on the basis of its economic costs.

Australia, an ally of the United States, has taken a similarly dim view of the Kyoto Protocol. Ahead of the November 2005 climate change meeting in Canada in which new goals for the protocol were to be discussed, Australia's Environment Minister, Ian Campbell, said that negotiating new greenhouse gas emission levels for the Kyoto Protocol would be a waste of time. Campbell said, "There is a consensus that the caps, targets and timetables approach is flawed. If we spend the next five years arguing about that, we'll be fiddling and negotiating while Rome burns." Campbell, like the Bush administration, has also advocated a system of voluntary action in which industry takes up new technologies rather than as a result of compelling the reduction of emissions. But the Australian Conservation Foundation (ACF) has called on its government to ratify the Kyoto Protocol, to establish a system of emissions trading, and to set binding limits on emissions. Interestingly, although it did not sign on to Kyoto, Australia was expected to meet its emissions target by 2012 (an 8 percent increase in 1990 levels in keeping with the country's reliance on coal). But this success has nothing to do with new technologies and is due to state-based regulations on land clearing.

Note: The Kyoto Protocol calls for developed nations to cut greenhouse emissions by 5.2 percent of 1990 levels by 2012.

Special Entry: Climate Change Summit in Copenhagen (2009) --

In December 2009, the United Nations Climate Change Summit opened in the Danish capital of

Copenhagen. The summit was scheduled to last from Dec. 7-18, 2009. Delegates from more than 190 countries were in attendance, and approximately 100 world leaders, including British Prime Minister Gordon Brown and [United States](#) President Barack Obama, were expected to participate. At issue was the matter of new reductions targets on greenhouse gas emissions by 2020.

Despite earlier fears that little concurrence would come from the conference, effectively pushing significant actions forward to a 2010 conference in [Mexico](#) City, negotiators were now reporting that the talks were productive and several key countries, such as [South Africa](#), had pledged to reduce greenhouse gas emissions. The two main issues that could still lead to cleavages were questions of agreement between the industrialized countries and the developing countries of the world, as well as the overall effectiveness of proposals in seriously addressing the perils of climate change.

On Dec. 9, 2009, four countries -- the [United Kingdom](#), [Australia](#), [Mexico](#) and [Norway](#) -- presented a document outlining ideas for raising and managing billions of dollars, which would be intended to help vulnerable countries dealing with the perils of climate change. Described as a "green fund," the concept could potentially help small island states at risk because of the rise in sea level. [Bangladesh](#) identified itself as a potential recipient of an assistance fund, noting that as a country plagued by devastating floods, it was particularly hard-hit by climate change. The "green fund" would fall under the rubric of the United Nations Framework Convention on Climate Change, for which developed countries have been committed to quantifying their emission reduction targets, and also to providing financial and technical support to developing countries.

The [United Kingdom](#), [Australia](#), [Mexico](#) and [Norway](#) also called for the creation of a new legal treaty that would replace the Kyoto Protocol. This new treaty, which could go into force in 2012, would focus largely on the reduction of greenhouse gas emissions by 2020. But [Australia](#) went even further in saying that the successor treaty to the Kyoto Protocol, should be one with provisions covering all countries. Such a move would be a departure from the structure of the Kyoto Protocol, which contained emissions targets for industrialized countries due to the prevailing view that developed countries had a particular historic responsibility to be accountable for climate change. More recently, it has become apparent that substantial reductions in greenhouse gas emissions demanded by scientists would only come to pass with the participation also of significant developing nation states, such as [China](#) and [India](#). Indeed, one of the most pressing critiques of the Kyoto Protocol was that it was a "paper tiger" that failed to address the impact of the actions of emerging economies like [China](#) and [India](#), with its focus on the developed economies.

Now, in 2009, [China](#) -- as the world's biggest greenhouse gas emitter -- was responding this dubious distinction by vocalizing its criticism of the current scenario and foregrounding its new commitments. Ahead of the Copenhagen summit, [China](#) had announced it would reduce the intensity of its carbon emissions per unit of its GDP in 2020 by 40 to 45 percent against 2005 levels. With that new commitment at hand, [China](#) was now accusing the [United States](#) and the European Union of shirking their own responsibilities by setting weak targets for greenhouse gas

emissions cuts. Senior Chinese negotiator, Su Wei, characterized the goals of the world's second largest greenhouse gas emitter -- the [United States](#) -- as "not notable," and the European Union's target as "not enough." Su Wei also took issue with [Japan](#) for setting implausible preconditions.

On Dec. 11, 2009, [China](#) demanded that developed and wealthy countries in Copenhagen should help deliver a real agreement on climate change by delivering on their promises to reduce carbon emissions and provide financial support for developing countries to adapt to global warming. In so doing, China's Vice Foreign Minister He Yafei said his country was hoping that a "balanced outcome" would emerge from the discussions at the summit. Echoing the position of the Australian government, He Yafei spoke of a draft agreement as follows: "The final document we're going to adopt needs to be taking into account the needs and aspirations of all countries, particularly the most vulnerable ones."

China's Vice Foreign Minister emphasized the fact that climate change was "a matter of survival" for developing countries, and accordingly, such countries need wealthier and more developed countries to accentuate not only their pledges of emissions reduction targets, but also their financial commitments under the aforementioned United Nations Framework Convention on Climate Change. To that end, scientists and leaders of small island states in the Indian Ocean, the Pacific Ocean and the Caribbean Sea, have highlighted the existential threat posed by global warming and the concomitant rise in sea level.

China aside, attention was also on [India](#) -- another major player in the developing world and a country with an industrializing economy that was impacting the environment. At issue was the Indian government's decision to set a carbon intensity target, which would slow emissions growth by up to 25 percent by the 2020 deadline. This strong position was resisted by some elements in [India](#), who argued that their country should not be taking such a strong position when developed wealthy countries were yet to show accountability for their previous commitments to reduce greenhouse gas emissions. The matter grew so heated that the members of the opposition stormed out of the parliament in protest as Indian Environment Minister Jairam Ramesh defended the policy. But the political pressure at home in [India](#) was leaving the Indian delegation in Copenhagen in a state of chaos as well. In fact, India's top environmental negotiator refused to travel to Copenhagen in protest of the government's newly-announced stance.

China and [India](#) were joined by [Brazil](#) and [South Africa](#) in the crafting of a draft document calling for a new global climate treaty to be completed by June 2010. Of concern has been the realization that there was insufficient time to find concurrence on a full legal treaty, which would leave countries only with a politically-binding text by the time the summit at Copenhagen closed. But Guyana's leader, President Bharrat Jagdeo, warned that the summit in [Denmark](#) would be classified as a failure unless a binding document was agreed upon instead of just political consensus. He urged his cohorts to act with purpose saying, "Never before have science, economics, geo-strategic self-interest and politics intersected in such a way on an issue that impacts

everyone on the planet."

Likewise, [Tuvalu](#) demanded that legally binding agreements emerge from Copenhagen. Its proposal was supported by many of the vulnerable countries, from small island states and sub-Saharan Africa, all of whom warned of the catastrophic impact of climate change on their citizens. [Tuvalu](#) also called for more aggressive action, such as an amendment to the 1992 agreement, which would focus on sharp greenhouse gas emissions and the accepted rise in temperatures, due to the impact the rise in seas. The delegation from [Kiribati](#) joined the call by drawing attention to the fact that one village had to be abandoned due to waist-high water, and more such effects were likely to follow. Kiribati's Foreign Secretary, Tessie Lambourne, warned that the people of [Kiribati](#) could well be faced with no homeland in the future saying, "Nobody in this room would want to leave their homeland." But despite such impassioned pleas and irrespective of warnings from the Intergovernmental Panel on Climate Change that the rise in sea level from melting polar ice caps would deleteriously affect low-lying atolls such as such as [Tuvalu](#) and [Kiribati](#) in the Pacific, and the [Maldives](#) in the Indian Ocean, the oil-giant [Saudi Arabia](#) was able to block this move.

Meanwhile, within the developed countries, yet another power struggle was brewing. The European Union warned it would only agree to raise its target of 20 percent greenhouse gas emissions reductions to 30 percent if the [United States](#) demonstrated that it would do more to reduce its own emissions. It was unknown if such pressure would yield results. [United States](#) President Barack Obama offered a "provisional" 2020 target of 17 percent reductions, noting that he could not offer greater concessions at Copenhagen due to resistance within the [United States](#) Congress, which was already trying to pass a highly controversial "cap and trade" emissions legislation. However, should that emissions trading bill fail in the Senate, the [United States](#) Environment Protection Agency's declaration that greenhouse gases pose a danger to human health and the environment was expected to facilitate further regulations and limits on power plants and factories at the national level. These moves could potentially strengthen the Obama administration's offering at Copenhagen. As well, President Obama also signaled that he would be willing to consider the inclusion of international forestry credits.

Such moves indicated willingness by the Obama administration to play a more constructive role on the international environmental scene than its predecessor, the Bush administration. Indeed, ahead of his arrival at the Copenhagen summit, President Barack Obama's top environmental advisors promised to work on a substantial climate change agreement. To that end, [United States](#) Environmental Protection Agency Administrator Lisa Jackson said at a press conference, "We are seeking robust engagement with all of our partners around the world." But would this pro-engagement assertion yield actual results?

By Dec. 12, 2009, details related to a draft document prepared by Michael Zammit Cutajar, the head of the Ad-hoc Working Group on Long-Term Cooperative Action, were released at the Copenhagen climate conference. Included in the document were calls for countries to make major

reductions in carbon emissions over the course of the next decade. According to the Washington Post, industrialized countries were called on to make cuts of between 25 percent and 40 percent below 1990 levels -- reductions that were far more draconian than the [United States](#) was likely to accept. As discussed above, President Obama had offered a provisional reduction target of 17 percent. The wide gap between the released draft and the United States' actual stated position suggested there was much more negotiating in the offing if a binding agreement could be forged, despite the Obama administration's claims that it was seeking greater engagement on this issue.

In other developments, the aforementioned call for financial support of developing countries to deal with the perils of climate change was partly answered by the European Union on Dec. 11, 2009. The European bloc pledged an amount of 2.4 billion euros (US\$3.5 billion) annually from 2010 to 2012. Environment Minister Andreas Carlgren of [Sweden](#) -- the country that holds the rotating presidency of the European Union at the time of the summit -- put his weight behind the notion of a "legally binding deal." Meanwhile, Yvo de Boer, a top United Nations climate change official, focused less on the essence of the agreement and more on tangible action and effects saying, "Copenhagen will only be a success if it delivers significant and immediate action that begins the day the conference ends."

The division between developed and developing countries in Copenhagen reached new heights on Dec. 14, 2009, when some of the poor and less developed countries launched a boycott at the summit. The move, which was spurred by African countries but backed by [China](#) and [India](#), appeared to be geared toward redirecting attention and primary responsibility to the wealthier and more industrialized countries. The impasse was resolved after the wealthier and more industrialized countries offered assurances that they did not intend on shirking from their commitments to reducing greenhouse gases. As a result, the participating countries ceased the boycott.

Outside the actual summit, thousands of protestors had gathered to demand crucial global warming, leading to clashes between police and demonstrators elsewhere in the Danish capital city. There were reports of scattered violence across Copenhagen and more than 1,000 people were arrested.

Nevertheless, by the second week of the climate change summit, hopes of forging a strong deal were eroding as developed and developing nations remained deadlocked on sharing cuts in greenhouse gases, and particularly on the matters of financing and temperature goals. In a bid to shore up support for a new climate change, [United States](#) President Barack Obama joined other world leaders in Copenhagen. On Dec. 14, 2009, there was a standoff brewing between the [United States](#) and [China](#). At issue was China's refusal to accept international monitoring of its expressed targets for reducing greenhouse gas emissions. The [United States](#) argued that China's opposition to verification could be a deal-breaker.

By the close of the summit, the difficult process eventually resulted in some consensus being

cultivated. A draft text called for \$100 billion a year by 2020 to assist poor nations cope with climate change, while aiming to limit global warming to two degrees Celsius compared with pre-industrial levels. The deal also included specific targets for developed countries to reduce greenhouse gas emissions, and called for reductions by developing countries as a share of their economies. Also included in the agreement was a mechanism to verify compliance. The details of the agreement were supported by President Barack Obama, Chinese Premier Wen Jiabao, Indian Prime Minister Manmohan Singh and Brazilian President Luiz Inacio Lula da Silva.

This draft would stand as an interim agreement, with a legally-binding international pact unlikely to materialize until 2010. In this way, the summit in Copenhagen failed to achieve its central objective, which was to negotiate a successor to the Kyoto Protocol on greenhouse gas emissions.

Editor's Note

In the background of these developments was the growing global consciousness related to global warming and climate change. Indeed, as the Copenhagen summit was ongoing, it was clear there was enormous concurrence on the significance of the stakes with an editorial on the matter of climate change being published in 56 newspapers in 45 countries. That editorial warned that without global action, climate change would "ravage our planet." Meanwhile, a global survey taken by Globescan showed that concern over global warming had exponentially increased from 1998 -- when only 20 percent of respondents believed it to be a serious problem -- to 64 percent in 2009. Such survey data, however, was generated ahead of the accusations by climate change skeptics that some climate scientists may have overstated the case for global warming, based on emails derived in an illicit manner from a British University.

Special Entry: Climate change talks in Doha in [Qatar](#) extend life of Kyoto Protocol (2012)

December 2012 saw climate talks ensue in the Qatari city of Doha as representatives from countries across the world gathered to discuss the fate of the Kyoto Protocol, which seeks to minimize greenhouse gas emissions. The summit yielded results with decisions made (1) to extend the Kyoto Protocol until 2020, and (2) for wealthier countries to compensate poorer countries for the losses and damage incurred as a result of climate change.

In regards to the second matter, Malia Talakai of [Nauru](#), a leading negotiator for the Alliance of Small Island States, explained the necessity of the compensation package as follows: "We are trying to say that if you pollute you must help us."

This measure was being dubbed the "Loss and Damage" mechanism, and was being linked with [United States](#) President Barack Obama's request for \$60 billion from Congress to deal with the devastation caused by Hurricane Sandy months before. The sight of a hurricane bearing down on

the northern Atlantic seaboard, along with the reality of the scope of reconstruction, appeared to have illustrated the economic costs of climate change -- not so much as a distant environmental issue -- but as a danger to the quotidian lives of people. Still, there was blame to be placed on the [United States](#) and European countries -- some of world's largest emitters -- for failing to do more to reduce emissions.

To that latter end, there was in fact little progress made on the central issue of reducing greenhouse gas emissions. Had those emissions been reduced, there would have been less of a need to financially deal with the devastation caused by climate change. One interpretation was that the global community was accepting the fact that industrialization was contributing to global warming, which had deleterious effects on the polar ice caps and concomitantly on the rise of sea level, with devastating effects for small island nations. Thus, wealthier countries were willing to pay around \$10 billion a year through 2020, effectively in "damages," to the poor countries that could be viewed as the "collateral damage" of industrial progress. But damages today could potentially be destruction tomorrow, leaving in place the existential challenges and burdens to be born by some of the world's smallest and least wealthy island countries.

Perhaps not surprisingly, the representative for the small island nation states at the Doha summit responded with ire, characterizing the lack of progress on reducing emissions as follows: "We see the package before us as deeply deficient in mitigation (carbon cuts) and finance. It's likely to lock us on the trajectory to a 3,4,5C rise in global temperatures, even though we agreed to keep the global average temperature rise of 1.5C to ensure survival of all islands. There is no new finance (for adapting to climate change and getting clean energy) -- only promises that something might materialize in the future. Those who are obstructive need to talk not about how their people will live, but whether our people will live."

Indeed, in most small island countries not just in the Pacific, but also the Caribbean and Indian Ocean, ecological concerns and the climate crisis have been dominant themes with dire life and death consequences looming in the background for their people. Small island nations in these region are already at risk from the rise of sea-level, tropical cyclones, floods. But their very livelihoods of fishing and subsistence farming were also at risk as a result of ecological and environmental changes. Increasingly high storm surges can wipe out entire villages and contaminate water supplies. Accordingly, the very existence of island nations, such as [Kiribati](#) and [Tuvalu](#), are at severe risk of being obliterated from the map. Yet even with the existential threat of being wiped off the map in the offing, the international community has been either slow or restrictive in its efforts to deal with global warming, climate change, economic and ecological damage, as well as the emerging global challenge of environmental refugees.

A 2012 report from the United Nations Environment Program (UNEP) and the Pacific Regional Environment Program underlined the concerns of small island nations and their people as it concluded that the livelihoods of approximately 10 million people in Pacific island communities

were increasingly vulnerable to climate change. In fact, low-lying islands in that region would likely confront losses of up to 18 percent of gross domestic product due to climate change, according to the report. The report covers 21 countries and territories, including [Fiji](#), [Kiribati](#), [Samoa](#) and [Tonga](#), and recommended environmental legislation intended to deal with the climate crisis facing the small island countries particularly. As noted by David Sheppard, the director general of the Pacific Regional Environment Program that co-sponsored this study: "The findings... emphasize the need more than ever to raise the bar through collective actions that address the region's environmental needs at all levels."

Regardless of the failures of the summit in [Qatar](#) (discussed above), the meeting did facilitate a process starting in 2015, which would bind both wealthy and poor countries together in the mission of forging a new binding treaty that would replace the Kyoto Protocol and tackle the central causes of climate change.

For more information on the threats faced in small island nations by climate change and the measures being undertaken to lobby for international action, please see the Alliance for Small Island States available online at the URL: <http://aosis.org/>

Special Report

COP 21 summit in Paris ends with historic agreement to tackle climate change; rare international consensus formed on environmental crisis facing the planet (2015) --

In mid-December 2015, the highly-anticipated United Nations climate conference of parties (COP) in Paris, [France](#), ended with a historic agreement. In fact, it would very likely be understood as the most significant international agreement signed by all the recognized countries of the world since the Cold War. Accordingly, the Paris Agreement was being distinguished as the first multilateral pact that would compel all countries across the world to cut its carbon emissions -- one of the major causes of increasing greenhouse gas emissions, which contribute to global warming, and its deleterious effects ranging from the dangerous rise in sea level to catastrophic climate change.

The accord, which was dubbed to be the "Paris Agreement," was the work of rigorous diplomacy and fervent environmental advocacy, and it aimed to address the climate change crisis facing the planet. As many as 195 countries were represented in the negotiations that led to the landmark climate deal. Indeed, it was only after weeks of passionate debate that international concurrence was reached in addressing the environmental challenges confronting the world, with particular attention to moving beyond fossil fuels and reducing greenhouse gas emissions.

The success of the COP 21 summit in Paris and the emergence of the landmark Paris Agreement

was, to some extent, attributed to the efforts of France's Foreign Minister Laurent Fabius who presided over the negotiations. The French foreign minister's experience and credentials as a seasoned diplomat and respected statesman paid dividends. He skillfully guided the delegates from almost 200 countries and interest groups along the negotiations process, with ostensibly productive results and a reasonably robust deal to show for it.

On Dec. 12, 2015, French Foreign Minister Fabius officially adopted the agreement, declaring: "I now invite the COP to adopt the decision entitled Paris Agreement outlined in the document. Looking out to the room I see that the reaction is positive, I see no objections. The Paris agreement is adopted." Once Foreign Minister Fabius' gavel was struck, symbolically inaugurating the Paris Agreement into force, the COP delegate rushed to their feet with loud and bouyant cheers as well as thunderous applause.

In general, the Paris Agreement was being hailed as a victory for enviromental activists and a triumph for international diplomats, while at the same time being understood as simply an initial -- and imperfect -- move in the direction of a sustainable future. China's chief negotiator, Xie Zhenhua, issued this message, saying that while the accord was not ideal, it should "not prevent us from marching historical steps forward."

United States President Barack Obama lauded the deal as both "ambitious" and "historic," and the work of strenuous multilateral negotiations as he declared, "Together, we've shown what's possible when the world stands as one." The [United States](#) leader acknowledged that the accord was not "perfect," but he reminded the critics that it was "the best chance to save the one planet we have."

Former [United States](#) Vice President Al Gore, one of the world's most well known environmental advocates, issued a lengthy statement on the accomplishments ensconced in the Paris Agreement. He highlighted the fact that the Paris Agreement was a first step towards a future with a reduced carbon footprint on Planet Earth as he said, "The components of this agreement -- including a strong review mechanism to enhance existing commitments and a long-term goal to eliminate global-warming pollution this century -- are essential to unlocking the necessary investments in our future. No agreement is perfect, and this one must be strengthened over time, but groups across every sector of society will now begin to reduce dangerous carbon pollution through the framework of this agreement."

The central provisions of the Paris Agreement included the following items:

- Greenhouse gas emissions should peak as quickly as possible, with a move towards balancing energy sources, and ultimately the decrease of greenhouse gases in the second half of this century
- Global temperature increase would be limited to 1.5 degrees Centigrade above pre-industrial levels and would be held "well below" the two degrees Centigrade threshold
- Progress on these goals would be reviewed every five years beginning in 2020 with new

greenhouse gas reduction targets issued every five years

- \$100 billion would be expended each year in climate finance for developing countries to move forward with green technologies, with further climate financing to be advanced in the years beyond

It should be noted that there both legally binding and voluntary elements contained within the Paris Agreement. Specifically, the submission of an emissions reduction target and the regular review of that goal would be legally mandatory for all countries. Stated differently, there would be a system in place by which experts would be able to track the carbon-cutting progress of each country. At the same time, the specific targets to be set by countries would be determined at the discretion of the countries, and would not be binding. While there was some criticism over this non-binding element, the fact of the matter was that the imposition of emissions targets was believed to be a major factor in the failure of climate change talks in Copenhagen, [Denmark](#), in 2009.

In 2015, the talks faced challenges as several countries, such as [China](#) and [India](#), objected to conditions that would stymie economic and development. In order to avoid that kind of landmine, a system Intended Nationally Determined Contributions (INDCs) was developed and formed the basis of the accord. As such, the Paris Agreement would, in fact, facilitate economic growth and development, as well as technological progress, but with the goal of long-term ecological sustainability based on low carbon sources. In fact, the agreement heralded as "the beginning of the end of the fossil fuel era." As noted by Nick Mabey, the head of the climate diplomacy organization E3G, said, "Paris means governments will go further and faster to tackle climate change than ever before. The transition to a low carbon economy is now unstoppable, ensuring the end of the fossil fuel age."

A particular sticking point in the agreement was the \$100 billion earmarked for climate financing for developing countries to transition from traditional fossil fuels to green energy technologies and a low carbon future. In 2014, a report by the International Energy Agency indicated that the cost of that transition would actually be around \$44 trillion by the mid-century -- an amount that would render the \$100 billion being promised to be a drop in the proverbial bucket. However, the general expectation was that the Republican-controlled Senate in the [United States](#), which would have to ratify the deal in that country, was not interested in contributing significant funds for the cause of climate change.

A key strength of the Paris Agreement was the ubiquitous application of measures to all countries. Of note was the frequently utilized concept of "flexibility" with regard to the Paris Agreement. Specifically, the varying capacities of the various countries in meeting their obligations would be anticipated and accorded flexibility. This aspect presented something of a departure from the 1997 Kyoto Protocol, which drew a sharp distinction between developed and developing countries, and mandated a different set of obligations for those categories of countries. Thus, under Kyoto, [China](#) and [India](#) were not held to the same standards as the [United States](#) and European

countries. In the Paris Agreement, there would be commitments from all countries across the globe.

Another notable strength of the Paris Agreement was the fact that the countries of the world were finally able to reach consensus on the vital necessity to limit global temperature increases to 1.5 degrees Centigrade. Ahead of the global consensus on the deal, and as controversy continued to surface over the targeted global temperature limits, the leaders of island countries were sounding the alarm about the melting of the Polar ice caps and the associated rise in sea level. Prime Minister Enele Sopoaga of [Tuvalu](#) issued this dismal reminder: "Tuvalu's future ... is already bleak and any further temperature increase will spell the total demise of [Tuvalu](#). No leader in this room carries such a level of worry and responsibility. Just imagine you are in my shoes, what would you do?" It was thus something of a victory for environmental advocates that the countries of the world could find consensus on the lower number -- 1.5 degrees rather than 2 degrees.

A significant weak point with regard to the Paris deal was a "loss and damage" provision, which anticipates that even with all the new undertakings intended to reduce greenhouse gas emissions and move to a low carbon future, there would nonetheless be unavoidable climate change consequences. Those consequences ranged from the loss of arable land for farmers as well as soil erosion and contamination of potable water by sea water, to the decimation of territory in coastal zones and on small islands, due to the rise in sea level, with entire small island countries being rendered entirely uninhabitable. The reality was that peoples' homes across the world would be destroyed along with their way of life.

With that latter catastrophic effect being a clear and present danger for small island countries, the Association of Small Island States (AOSIS) demanded that the developed world acknowledge its responsibility for this irreversible damage.. Despite the fact that greenhouse gas emissions and the ensuing plague of global warming was, indeed, the consequence of development in the West (the [United States](#) and Europe) and the large power house countries, such as [Russia](#), [China](#) and [India](#), there was no appetite by those countries to sign on to unlimited liability. Under the Paris Agreement, there was a call for research on insurance mechanisms that would address loss and damage issues, with recommendations to come in the future.

The call for research was being regarded as an evasion of sorts and constituted the weakest aspect of the Paris Agreement. Not surprisingly, a coalition of small island nations demanded a "Marshall Plan" for the Pacific. Borrowing the term "Marshall Plan" from the post-World War II reconstruction effort, the coalition of Pacific island nation, which included [Kiribati](#), [Tuvalu](#), [Fiji](#), and the [Marshall Islands](#), called for an initiative that would include investment in renewable energy and shoreline protection, cultural preservation, economic assistance for economies in transition, and a plan for migration and resettlement for these countries as they confront the catastrophic effects of the melting of the Polar ice caps and the concomitant rise in sea level. The precise contours of the initiative remained unknown, unspecified, and a mere exercise in theory at the time

of writing. Yet such an initiative would, at some point, have to be addressed, given the realities of climate change and the slow motion calamity unfolding each day for low-lying island nations across the world.

As noted by Vice President Greg Stone of Conservation International, who also functions as an adviser to the government of [Kiribati](#), “Imagine living in a place where you know it’s going to go away someday, but you don’t know what day that wave’s going to come over and wash your home away.” He added, “It’s a disaster we know is going to happen.” Meanwhile, the intervening years promised to be filled with hardship for small island nations, such as [Kiribati](#). Stone explained, “For every inch of sea-level rise, these islands lose 10 feet of their freshwater table to saltwater intrusion,” Stone explained. “So it’s not just about the day the water finally goes over the island; it’s also about the day that there’s just not enough water left and everyone has to move off the island.” Presaging the future for island nations that could face submersion, Stone said, “If you look ahead 50 years, a country like [Kiribati](#) could become the first aqueous nation. possibility of migration. That is, they own this big patch of ocean, and they administer it from elsewhere.”

Foreign Minister Minister Tony Debrum of the [Marshall Islands](#) emerged as the champion advocating on behalf of small island nation states and a loose coalition of concerned countries from the Pacific to the Caribbean, but with support from the [United States](#). He addressed the comprehensive concerns of small island nations regarding the weaknesses of the deal, while simultaneously making clear that the Paris Agreement signified hope for the countries most at risk. In a formal statement, Debrum declared: “We have made history today. Emissions targets are still way off track, but this agreement has the tools to ramp up ambition, and brings a spirit of hope that we can rise to this challenge. I can go back home to my people and say we now have a pathway to survival.” Debrum highlighted the imperatives of Pacific island nations, saying, “Our High Ambition Coalition was the lightning rod we needed to lift our sights and expectations for a strong agreement here in Paris. We were joined by countries representing more than half the world. We said loud and clear that a bare-bones, minimalist agreement would not fly. We instead demanded an agreement to mark a turning point in history, and the beginning of our journey to the post-carbon era.”

Debrum of the [Marshall Islands](#) espoused the quintessential synopsis of the accord and its effects for those most likely to be affected by climate change as he noted, “Climate change won’t stop overnight, and my country is not out of the firing line just yet, but today we all feel a little safer.”

Editor's Entry on [Environmental Policy](#):

The low-lying Pacific island nations of the world, including [Kiribati](#), [Tuvalu](#), the [Marshall Islands](#), [Fiji](#), among others, are vulnerable to the threats posed by global warming and climate change, derived from carbon emissions, and resulting in the rise in sea level. Other island nations in the

Caribbean, as well as poor countries with coastal zones, were also at particular risk of suffering the deleterious effects of climate change.

Political policy in these countries are often connected to ecological issues, which have over time morphed into an existential crisis of sorts. Indeed, ecological concerns and the climate crisis have also been dominant themes with life and death consequences for the people of island nations in the Pacific. Indeed, the very livelihoods of fishing and subsistence farming remain at risk as a result of ecological and environmental changes. Yet even so, these countries are threatened by increasingly high storm surges, which could wipe out entire villages and contaminate water supplies. Moreover, because these are low lying island nations, the sustained rise in sea level can potentially lead to the terrain of these countries being uninhabitable at best, and submerged at worst. Stated in plain terms, these countries are at severe risk of being obliterated from the map and their plight illuminates the emerging global challenge of environmental refugees. In these manifold senses, climate change is the existential crisis of the contemporary era.

Since the time of the 1997 Kyoto Protocol, there have been efforts aimed at extending the life of that agreement, with an eye on minimizing greenhouse gas emissions, and thus minimizing the effects of climate change. Those endeavors have largely ended in failure, as exemplified by the unsuccessful Copenhagen talks in 2009 and the fruitless Doha talks in 2012 respectively. The success of the COP 21 talks in [France](#), with the adoption of the landmark Paris Agreement in 2015, was regarded as the first glimmer of hope. Not only did the Paris Agreement signify the triumph of international diplomacy and global consensus, but it also marked the start of the end of the fossil fuel era, with the path forward toward a low carbon future reliant on greener technologies. Most crucially, the Paris Agreement stood as the first significant response in recent times to the central challenge of climate change and its quotidian effects on the lives of real human beings across the world.

1. Major International Environmental Accords:

General Environmental Concerns

Convention on Environmental Impact Assessment in a Transboundary Context, Espoo, 1991.

Accords Regarding Atmosphere

Annex 16, vol. II (Environmental Protection: Aircraft Engine Emissions) to the 1044 Chicago Convention on International Civil Aviation, Montreal, 1981

Convention on Long-Range Transboundary Air Pollution (LRTAP), Geneva, 1979

United Nations Framework Convention on Climate Change (UNFCCC), New York, 1992

Vienna Convention for the Protection of the Ozone Layer, Vienna, 1985 including the Montreal Protocol on Substances that Depleted the Ozone Layer, Montreal, 1987

Accords Regarding Hazardous Substances

Convention on the Ban of the Import into Africa and the Control of Transboundary Movements and Management of Hazardous Wastes within Africa, Bamako, 1991

Convention on Civil Liability for Damage Caused during Carriage of Dangerous Goods by Road, Rail and Inland Navigation Vessels (CRTD), Geneva, 1989

Convention on the Control of Transboundary Movements of Hazardous Wastes and their Disposal (Basel Convention), Basel, 1989

Convention on the Transboundary Effects of Industrial Accidents, Helsinki, 1992

Convention to Ban the Importation into Forum Island Countries of Hazardous and Radioactive Wastes and to Control the Transboundary Movement and Management of Hazardous Wastes within the South Pacific Region (Waigani Convention), Waigani, 1995

European Agreement Concerning the International Carriage of Dangerous Goods by Road (ADR), Geneva 1957

FAO International Code of Conduct on the Distribution and Use of Pesticides, Rome, 1985

2. Major International Marine Accords:

Global Conventions

Convention on the Prevention of Marine Pollution by Dumping of Wastes and Other Matter (London Convention 1972), London, 1972

International Convention for the Prevention of Pollution from Ships, 1973, as modified by Protocol of 1978 relation thereto (MARPOL 73/78), London, 1973 and 1978

International Convention on Civil Liability for Oil Pollution Damage 1969 (1969 CLC), Brussels, 1969, 1976, and 1984

International Convention on the Establishment of an International Fund for Compensation for Oil Pollution Damage 1971 (1971 Fund Convention), Brussels, 1971

Convention on Liability and Compensation for Damage in Connection with the Carriage of Hazardous and Noxious Substances by Sea (HNS), London 1996

International Convention on Oil Pollution Preparedness, Response, and Co-operation (OPRC), London, 1990

International Convention Relation to Intervention on the High Seas in Cases of Oil Pollution Casualties (Intervention Convention), Brussels, 1969

United Nations Convention on the Law of the Sea (UNCLOS), Montego Bay, 1982

Regional Conventions

Convention for the Prevention of Marine Pollution by Dumping from Ships and Aircraft (Oslo Convention), Oslo, 1972

Convention for the Prevention of Marine Pollution from Land-based Sources (Paris Convention), Paris, 1974

Convention for the Protection of the Marine Environment of the North East Atlantic (OSPAR Convention), Paris, 1992

Convention for the Protection of the Marine Environment of the Baltic Sea Area (1974 Helsinki Convention), Helsinki 1974

Convention for the Protection of the Marine Environment of the Baltic Sea Area (1992 Helsinki Convention), Helsinki 1992

Conventions within the UNEP Regional Seas Programme

Convention on the Protection of the Black Sea against Pollution, Bucharest, 1992

Convention for the Protection and Development of the Marine Environment of the Wider Caribbean Region, Cartagena de Indias, 1983

Convention for the Protection, Management, and Development of the Marine and Coastal Environment of the Eastern African Region, Nairobi, 1985

Kuwait Regional Convention for Co-operation on the Protection of the Marine Environment from Pollution, [Kuwait](#), 1978

Convention for the Protection and Development of the Marine Environment and Coastal Region of the Mediterranean Sea (Barcelona Convention), Barcelona, 1976

Regional Convention for the Conservation of the Red Sea and Gulf of Aden Environment, Jeddah, 1982

Convention for the Protection of the Natural Resources and Environment of the South Pacific Region, Noumea, 1986

Convention for the Protection of the Marine Environment and Coastal Area of the South-East Pacific, Lima, 1981

Convention for Co-operation in the Protection and Development of the Marine and Coastal Environment of the West and Central African Region, Abidjan, 1981

3. Major Conventions Regarding Living Resources:

Marine Living Resources

Convention on the Conservation of Antarctic Marine Living Resources (CCAMLR), Canberra, 1980

International Convention for the Conservation of Atlantic Tunas (ICCAT), Rio de Janeiro, 1966

International Convention for the Regulation of Whaling (ICRW), Washington, 1946

Nature Conservation and Terrestrial Living Resources

Antarctic Treaty, Washington, D.C., 1959

Convention Concerning the Protection of the World Cultural and Natural Heritage (World Heritage Convention), Paris, 1972

Convention on Biological Diversity (CBD), Nairobi, 1992

Convention on the Conservation of Migratory Species of Wild Animals (CMS), Bonn, 1979

Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES), Washington, D.C., 1973

Convention on Wetlands of International Importance especially as Waterfowl Habitat (Ramsar Convention), Ramsar, 1971

Convention to Combat Desertification (CCD), Paris 1994

FAO International Undertaking on Plant Genetic Resources, Rome, 1983

International Tropical Timber Agreement, 1994 (ITTA, 1994), Geneva, 1994

Freshwater Resources

Convention on the Protection and Use of Transboundary Watercourses and International Lakes, Helsinki, 1992

4. Major Conventions Regarding Nuclear Safety:

Convention on Assistance in the Case of a Nuclear Accident or Radiological Emergency (Assistance Convention), Vienna, 1986

Convention on Early Notification of a Nuclear Accident (Notification Convention), Vienna, 1986

Convention on Nuclear Safety, Vienna, 1994

Vienna Convention on Civil Liability for Nuclear Damage, Vienna, 1963

5. Major Intergovernmental Organizations

Commission on Sustainable Development (CSD)

European Union (EU): Environment

Food and Agriculture Organization (FAO)

Global Environment Facility (GEF)

International Atomic Energy Agency (IAEA)

International Council for the Exploration of the Sea (ICES)

International Fund for Agricultural Development (IFAD)

International Labour Organization (ILO)

International Maritime Organization (IMO)

International Monetary Fund (IMF)

International Oil Pollution Compensation Funds (IOPC Funds)

Organization for Economic Co-operation and Development (OECD), Environment Policy Committee (EPOC)

United Nations Children's Fund (UNICEF)

United Nations Development Programme (UNDP)

United Nations Educational, Scientific, and Cultural Organization (UNESCO)

United Nations Environment Programme (UNEP)

United Nations Industrial Development Organization (UNIDO)

United Nations Population Fund (UNFPA)

World Bank

World Food Programme (WFP)

World Health Organization (WHO)

World Meteorological Organization (WMO)

World Trade Organization (WTO)

6. Major Non-Governmental Organizations

Atmosphere Action Network East Asia (AANE)

Climate Action Network (CAN)

Consumers International (CI)

Earth Council

Earthwatch Institute

Environmental Liaison Centre International (ELCI)

European Environmental Bureau (EEB)

Forest Stewardship Council (FSC)

Friends of the Earth International (FoEI)

Greenpeace International

International Chamber of Commerce (ICC)

International Confederation of Free Trade Unions (ICFTU)

International Planned Parenthood Federation (IPPF)

International Solar Energy Society (ISES)

IUCN-The World Conservation Union

Pesticide Action Network (PAN)

Sierra Club

Society for International Development (SID)

Third World Network (TWN)

Water Environment Federation (WEF)

Women's Environment and Development Organization (WEDO)

World Business Council for Sustainable Development (WBCSD)

World Federalist Movement (WFM)

World Resources Institute (WRI)

World Wide Fund For Nature (WWF)

7. Other Networking Instruments

Arab Network for Environment and Development (RAED)

Global Legislators for a Balanced Environment (GLOBE)

Regional Environmental Center for Central and Eastern Europe (REC)

United Nations Non-Governmental Liaison Service (UN-NGLS)

Methodology Notes for Economic Data:

Estimates by CountryWatch.com of GDP in dollars in most countries are made by converting local currency GDP data from the International Monetary Fund World Economic Outlook to US dollars by market exchange rates estimated from the International Monetary Fund International Financial Statistics and projected out by the CountryWatch Macroeconomic Forecast. Real GDP was estimated by deflating current dollar values by the US GDP Implicit Price Deflator.

Exceptions to this method were used for:

- Bosnia-Herzegovina
- Nauru
- Cuba
- Palau
- Holy See
- San Marino
- Korea, North
- [Serbia](#) & Montenegro
- Liberia
- Somalia
- Liechtenstein
- Tonga
- Monaco
- Tuvalu

In these cases, other data and/or estimates by CountryWatch.com were utilized.

Methodology Notes for the HDI:

Since 1990, the United Nations Development Programme, in concert with organizations across the globe, has produced the [Human Development Index](#) (or HDI). According to the UNDP, the index measures average achievement in basic human development in one simple composite index, and produces from this index a ranking of countries. The HDI is a composite of three basic components of human development: longevity, knowledge and standard of living. Longevity is measured by life expectancy. Knowledge is measured by combination of adult literacy and mean

years of schooling. Standard of living is measured by purchasing power, based on real GDP per capita (in constant US\$) adjusted for differences in international living costs (or, purchasing power parity, PPP). While the index uses these social indicators to measure national performance with regard to human welfare and development, not all countries provide the same level of information for each component needed to compute the index; therefore, as in any composite indicator, the final index is predicated on projections, predictions and weighting schemes. The index is a static measure, and thus, an incomplete measure of human welfare. In fact, the UNDP says itself the concept of human development focuses on the ends rather than the means of development and progress, examining in this manner, the average condition of all people in a given country.

Specifically, the index is calculated by determining the maximum and minimum for each of the three components (as listed above) and then measuring where each country stands in relation to these scales-expressed as a value between 0 and 1. For example, the minimum adult literary rate is zero percent, the maximum is 100 percent, and the reading skills component of knowledge in the HDI for a country where the literacy rate is 75 percent would be 0.75. The scores of all indicators are then averaged into the overall index.

For a more extensive examination of human development, as well as the ranking tables for each participating country, please visit: <http://www.undp.org>
