Country Overview

Country Overview

UZBEKISTAN

Uzbekistan is located in the heart of Central Asia on the ancient Great Silk Road between Europe and Asia. The area had been conquered by the Turks, the armies of Alexander the Great, the Arabs, and the Mongols, before it was annexed by Russia in the late 19th century as part of the region then known as Turkestan. Uzbekistan became a republic within the Soviet Union in 1924, and gained independent in 1991 following the collapse of the Soviet Union. The country's political system is highly authoritarian, and the media is tightly controlled by the state. With a population of around 27.5 million, Uzbekistan is the most populous country in Central Asia. The country has a strong agricultural base and is one of the world's largest producers of cotton. It is also endowed with abundant natural resources, including hydrocarbons, gold, copper, and uranium.

Key Data

Key Data	
Region:	Central Asia
Population:	29199942
Climate:	Mostly midlatitude desert, long, hot summers, mild winters, semiarid grassland in east
Languages:	Uzbek (74%) Russian (14.2%) Tajik (4.4%) Other (7.1%)
Currency:	sum (UKS)
Holiday:	Independence Day is 1 September (1991), Constitution Day is 8 December
Area Total:	447400
Area Land:	425400
Coast Line:	0

Chapter 2

Political Overview

History

The history of the Uzbeks and their homeland is closely tied to that of Turkestan, an ancient territory stretching from the Caspian Sea in the west, and extending into China and Afghanistan in the east. Turkestan encompassed most of the areas of the present-day Turkmen; the Uzbek, Tajik, and Kyrgyz Republics; and the southern portion of the Kazakh Republic.

In the centuries before the current era, people of Persian heritage populated Turkestan and endured successive waves of invaders. In the sixth century B.C.E., Turkestan, for the most part, belonged to the Persian Achaemenid Empire. Alexander the Great invaded Turkestan in the fourth century B.C.E., and the Huns overran the area in the fifth century C.E. Arabs conquered Turkestan in the seventh century C.E. and introduced the Islamic religion and culture.

Another series of invasions by predominantly Turkic peoples began at the end of the 10th century and continued into the 13th century when the great Mongol invasion swept the area. The Mongol invaders were soon assimilated by the Turkic population and adopted their language, culture and religion.

In the beginning of the 16th century, Turkestan was conquered by yet another wave of Turkic nomads, the Uzbeks. The Uzbeks, whose name derives from Uzbek Khan, the ruler of the Mongols at the beginning of the 14th century, were a mixture of Turkic tribes within the Mongol Empire. The center of the Uzbek state became the city of Bukhara.

Subsequently, the independent Uzbek khanates of Khiva and Kokand evolved. The khanates of Bukhara, Khiva and Kokand inherited aspects of the Iranian, Turkic and Arabic civilizations. Their populations were mostly Uzbek, but considerable numbers of Tajiks, Turkmens and Kyrgyz were also resident.

By the 18th century, the khans of Khiva, Bukhara and Kokand had extended their control over the innumerable independent tribal kingdoms and ruled central Turkestan. The process of consolidation, however, was not complete; many peripheral areas in Turkestan remained almost totally independent of, or in rebellion against, one or another of the three khanates.

In the vast steppes and deserts in the north, the Kazakhs continued their traditional way of life, grazing their herds. The nomadic Turkmen roamed the wide stretches of pastureland to the west; the Kyrgyz made their home in the mountainous valleys in the east. The Tajiks maintained their established lifestyle in the southeast, in the highlands north of the Hindu Kush.

Although Peter the Great attempted the first Russian invasion of Turkestan in the beginning of the 18th century, systematic Russian penetration of Turkestan was undertaken only in the mid-19th century. By the end of the 19th century, the khanates of Bukhara and Khiva, greatly reduced in size, had become vassal states of the Russian Empire. The rest of the territory and the entire territory of Kokand were incorporated into Russian Turkestan, which was divided into five provinces and presided over by a Russian governor general. Turkestan, together with the four provinces of Kazakhstan, constituted what came to be known as Russian Central Asia (subsequently Soviet Central Asia).

In spite of czarist tolerance of the Muslim religion and customs, Russian conquest of Turkestan had an immediate impact on some of the indigenous culture and society. Early in the 20th century, economic development came to Turkestan; new towns sprang up; cotton grew where once nomads had grazed their herds; and railroads linked Turkestan with markets in Russia. The nomadic Kyrgyz, Kazakhs and Turkmen were especially resentful of these changes.

In 1916, when the Russian government ended its exemption of Muslims from military service, much of Russian Central Asia rose in a general revolt against Russian rule. A year later, in November 1917, the Bolsheviks established Soviet power in the city of Tashkent. In April 1918, they proclaimed the Turkestan Autonomous Republic. The great mass of the Muslim population, however, took no part in these events. Only after the Bolsheviks attacked the Muslim religion, intervened directly in native society and culture, and engaged in armed seizure of food did the indigenous population offer fierce resistance in a national and holy war against the Soviet regime, known as the Basmachi Rebellion.

The autonomous Soviet republics of Khorzem (formerly Khiva) and Bukhara were established in 1920 and incorporated into the Soviet Union. In 1924 and 1925, the entire Soviet Central Asian territory was reorganized by an act known as the national delimitation process in Central Asia.

The Turkestan Autonomous Republic was abolished and divided along ethnic and linguistic lines into the Uzbek and Turkmen union republics, the Tajik Autonomous Republic within the Uzbek Republic, and the Kyrgyz Autonomous Republic and the Karakalpak Autonomous Oblast within the Russian Republic. At the same time, the Kazakh Autonomous Republic within the Russian Republic was also established.

The Tajik Autonomous Republic became a union republic in 1929, and the Kyrgyz Autonomous

Republic became a union republic in 1936. The Karakalpak Autonomous Oblast became an autonomous republic in 1932, and was transferred to the Uzbek Republic in 1936. The same year, the Kazakh Autonomous Republic was transformed into a union republic.

Meanwhile, the Uzbek Republic, although technically autonomous, remained under the control of the Communist Party. Beginning in the 1930s, Uzbekistan suffered from a number of political purges, especially among the intelligentsia and political leadership, at the hands of the communist authorities.

The death of Soviet leader Joseph Stalin in 1953 brought some degree of a reprieve, and by the mid-1950s, the Uzbek Republic began to re-institute contact with the outside world. A further relaxation of media and socio-political controls ensued under the Soviet leader, Mikhail Gorbachev, in the 1980s.

Soviet communist authority persisted well until 1991 when the Soviet Union crumbled. That year, Uzbekistan declared its independence, and Islom Karimov, the leader of the Communist Party of Uzbekistan, was elected president. Thus, the influence and authority of the Communist Party persisted. Democratization was not a reality in the newly-independent state. Opposition parties and groups were prohibited, and violence was directed at pro-democracy activists. Moreover, as Uzbekistan gradually adopted the symbols of sovereignty, such as a national flag, anthem and constitution, the nation became increasingly nationalistic and ethnocentric, which result in a mass exodus of ethnic minorities.

Note on History: In certain entries, open source content from the State Department Background Notes and Country Guides have been used. A full listing of sources is available in the Bibliography.

Political Conditions

Editor's Note:

Uzbekistan, a former Soviet republic in Central Asia, has been independent since the fall of the Soviet Union in 1991. Since that time, it has been ruled by Islom Karimov. Although his regime has been known for its autocratic style and has been accused of human rights abuses, the United States has lauded the country for its assistance in the war on terror. For many years, Uzbekistan, with its predominantly Muslim population, was regarded as a fairly stable country. Religious extremism did not pose a problem and the country was renowned for its religious moderation. But

in 2004, a violent attack occurred in the capital city of Tashkent, which the government attributed to the actions of a radical Islamic movement. An uprising in the town of Andijan a year later (in 2005) was attributed to Islamic extremists, according to the government. It was a position not necessarily shared by other observers. The violent crackdown by the government that occurred in the aftermath was so severe that human rights groups have called for accountability. Issues related to the situation in Andijan have continued to dominate the political spectrum in Uzbekistan to date.

Political Developments

For the first time since 1924, non-communist parties emerged in 1991 and were allowed to legally exist. The "Birlik" (Unity) Party and the "Erk" (Freedom) Party have been the main parties in competition with the Popular Democratic Party (formerly the Uzbek Communist Party). Despite this legal consent for opposition entities to operate, few parties except for the People's Democratic Party have held any legislative seats, and democratic activity has been severely suppressed.

In 1991, elections were held and Abduganiyevich Karimov (of the Popular Democratic Party) was elected. Despite the rhetoric asserting Uzbekistan's democratization process, most observers considered this election neither free nor fair. The Popular Democratic Party was accused by members of other parties of preventing public meetings, suppressing the "Birlik" newspaper, harassing and arresting opposition members, regularly denying "Birlik" and "Erk" Party organizers access to the media, and of Karimov's communist followers arranging his election. (Note: Birlik and Erk activities and meetings were eventually banned altogether; see below for information about the resumption of party politics in 2003.)

Nevertheless, by a referendum held in 1995, Karimov's tenure was extended and parliament voted to make this extension part of his first term. This extension made him eligible to run for office again.

During the time the Karimov administration has been in power, the government of Uzbekistan became increasingly repressive, characterized by the silencing of opposition entities and democratization movements, as well as a disregard for human rights. In 1996, recognizing the ire of the international community with regard to its questionable measures, the Karimov administration introduced new legislation to curb human rights violations, and the possible recognition of the Human Rights Society seemed to be in the works. Nevertheless, other limits on human rights and freedoms were advanced, including the imprisonment in mid-1999 of the brother of a leading opposition figure. Also that year, a well-known human rights activist claimed that police attacked him after being arrested and taken into custody. The funeral of the son of a well-known Muslim activist, who had died in police custody, was also held around that time frame.

Civil unrest in Uzbekistan, resulted in continuing efforts by the government against terrorists. In early 1999, there were several bomb attacks in the capital city of Tashkent. By June, six people were sentenced to death and 16 others to long prison terms as a result of their involvement in the bombings.

In so far as economic development and civil conditions are concerned, Karimov's administration refused to implement a market economy system, which was deemed a threat to the nation state's stability. A very slow process of privatization began in late 1993, but strict controls were maintained. The Karimov administration rejected in mid-1999 the idea of an economic or customs union with other former Soviet republics, on the basis that the "block mentality" would impede national agendas and interests.

Although its population is predominantly Muslim, Islamic fundamentalism had not typically been an issue in Uzbekistan. Indeed, the Karimov administration has -- at times -- been adamant about disallowing Islamic fundamentalism from growing. By way of illustration, the Uzbek government supported the communist regime in Tajikistan against the Islamic insurgency originating in Afghanistan. Suddenly, however, in 1995, the Uzbek government reversed its policy by meeting with the head of the Tajik Islamic opposition. This reversal was generally interpreted as a result of Uzbek apprehension over increased Russian troops presence in the region. Despite this strategic shift, however, the Karimov administration has generally tried to stymie religious expression, which it fears will give rise to religious extremism. In 1998, tough new laws on religion were enacted; these new laws were aimed at limiting the religious activity of people. The following year, in the face of such legislation, leaflets and other such paraphernalia were uncovered calling for an Islamic state in Uzbekistan and the removal of Karimov.

Throughout the 1990s, Russia and other entities continued to express concern over civil and human rights issues in Uzbekistan, and the Uzbek government continued to concentrate its efforts on containing the Islamic threat. Border problems with Tajikistan arose when, in August 1999, a group of armed Islamic activists based in Tajikistan crossed into southern Kyrgyzstan, demanding to be allowed to enter Uzbekistan, the country of origin of many of the insurgents. Violence ensued and the Uzbek air force bombed both the group and their bases in Tajikistan. The Tajik government protested the bombings, describing them as unprecedented, and Uzbekistan denied knowledge of the attack. Karimov later said that the Uzbek military was fully entitled to act against terrorists in Tajikistan.

On Dec. 5, 1999, parliamentary elections were held in Uzbekistan to fill the 250 seats of the "Oli Majlis" (National Assembly). Candidates in the election represented five political parties, and the Central Election Committee (CEC) reported that 92 percent of the electorate turned out to vote. Eighty-three members were elected directly and 167 members were voted in by local councils, all for five-year terms. About 20,000 observers representing the interests of candidates oversaw the election, as well as 42 international observers from 25 nations, including a special assessment team

of the Organization for Security and Cooperation in Europe (OSCE), which found the election proceedings to be seriously flawed.

A presidential election was held in Uzbekistan on January 9, 2000. The two candidates who ran for the position were incumbent President Islom Karimov of the Fidokorlar National Democratic Party and Abdulhafiz Jalalov of the People's Democratic Party. The OSCE refused to send observers to monitor the election, stating that voters would not be given any genuine choice in the ballot. According to foreign observers, the Uzbek government declined to register truly independent opposition parties, and it did not allow members of those parties to run for president. Even Karimov's opponent, Jalalov, appeared to be running merely to provide a semblance of competition. He was a public supporter of the Karimov, and he even stated that he intended to vote for the incumbent president. As expected, Karimov collected 91.9 percent of the vote, with Jalalov receiving 4.17 percent. The CEC announced that 95.9 percent of eligible voters participated in the election, and that 3.92 percent of the votes were invalid.

The Uzbek cabinet resigned following Karimov's re-election, and in February 2000, a new cabinet was appointed. Utkir Sultanov took the position of prime minister at that time.

Regardless of the issues surrounding the presidential elections, President Karimov moved, albeit slowly, to liberalize the depressed economy. Despite the possibility of social unrest if reforms lead to temporary lower living standards and unemployment, he promised to extend privatization, assist small businesses, and free the Uzbek currency in order to win International Monetary Fund (IMF) approval.

The events of September 11, 2001, in the United States and the resulting war on terrorism in Afghanistan provided the Karimov government with a new sense of urgency in dealing with the major Islamic fundamentalist groups, including the Islamic Movement of Uzbekistan (IMU) and the Hezb ut-Tahrir. The IMU, an armed group that seeks the creation of an Islamic state in Central Asia is recognized by the United States Department of State as a foreign terrorist organization. It was reported to have been operating out of bases in Afghanistan against targets in Uzbekistan. The Hezb ut-Tahrir is a secretive Islamic organization that also seeks the establishment of an Islamic state in Central Asia but has not appeared to have resorted to violence and has not clearly outlined its goals in the region. The government of Uzbekistan has continued to arrest and detain members of both groups in the movement to thwart anti-government activities.

Meanwhile, the government in Uzbekistan has been one of the major supporters of the coalition forces' attacks against the Taliban regime in Afghanistan. On Oct. 5, 2001, the Karimov government authorized the use of Uzbekistan bases for United States military forces, which were staging for attacks against the al-Qaida network in Afghanistan and the Taliban government. The United States in turn provided Uzbekistan with substantial economic assistance and humanitarian aid.

In January 2002, the government called for, and held, a nationwide referendum to extend the term of the president to seven years and to create a bicameral legislature. Each item passed by a vote of over 90 percent and resulted in the following provisions: President Karimov would remain in office until December 2007 and the parliamentary elections in 2004 would be held to elect members of a yet-to-be-created bicameral legislature.

In March 2002, the new President of Afghanistan, Hamed Karzai, made a visit to Tashkent to thank President Karimov for his efforts to help in the war in Afghanistan. Later in the month, President Karimov went to Washington for a visit with President Bush where he again was thanked for his efforts in the war against terrorism.

A report in July 2002 stated that Islamic Movement of Uzbekistan (IMU) forces were regrouping in the Badakshan province of Afghanistan under the leadership of Djuma Namangani, the military commander of the IMU. The report set off a flurry of activity by officials in Kyrgyzstan, Tajikistan and Uzbekistan. There remained some question as to whether Namangani was still alive (he was eventually determined to have been killed in August 2002). The reports increased concern, however, on the parts of all three governments concerning future actions by the IMU.

The continued efforts against Islamic fundamentalists have led to continuing charges by human rights groups concerning treatment of prisoners. In August 2002 the bodies of two Uzbek men jailed for their alleged membership in the Hezb ut-Tahrir were turned over to their relatives for burial, leaving questions surrounding their deaths in prison. The government, at the same time, has taken steps to counter this image by allowing foreign correspondents to meet with members of the IMU who have detailed their terrorist activities for the media.

In May 2003, Uzbekistan's capital city of Tashkent hosted the annual meeting of European Bank for Reconstruction and Development. During the meeting, officials expressed regret over the country's human rights problems, and also over President Karimov's failure to condemn torture.

In mid-2003, the Birlik political movement, which had been banned in political crackdowns, re-entered the political fray for the first time in about a decade. Likewise, the opposition group Erk, which had been banned over a decade ago, held a meeting and vowed to become more politically active in preparation for new elections.

Meanwhile, also in mid-2003, Uzbekistan received one of the lowest ratings of all former Soviet republics from the World Bank for its anemic economic growth and poor standard of living. The World Bank criticized the government for slow and ineffectual reforms, and ranked Uzbekistan as one of the countries in the world with the least amount of regulatory transparency.

In December 2003, faced with the country's least impressive cotton harvest and rising economic

woes, President Karimov removed Prime Minister Otkir Sultanov from office. Sultanov was replaced by Shavkat Mirziyayev.

In March 2004, Uzbekistan was faced with a spate of disturbing bombings and shootings. The government speculated that the attacks were the work of Islamic extremists. Such attacks were rarely experienced on Uzbek soil prior to its commitment to the global war on terror and indeed, Uzbekistan has generally been spared the challenges of Islamic insurgencies due to its moderate stances.

In April 2004, the European Bank for Reconstruction and Development announced it was cutting aid to Uzbekistan because of the country's record on economic reform and its failure to deal with human rights abuses. The decision came almost a year after Uzbekistan hosted the annual meeting of European Bank for Reconstruction and Development. As noted above, the issue of human rights in Uzbekistan has continued to be unresolved.

In July 2004, the city of Tashkent was hit by violence when suicide bombers targeted the embassies of the United States and Israel. A third blast targeted the General Prosecutor's Office. The specific targets led to speculation that Islamic extremists at odds with the policies of the Uzbek government may have been responsible.

In November 2004, with an economy still suffering, new restrictions on trading practices were not well received. As such, mass protests by several thousands of people ensued in city of Kokand.

Also in November 2004, regional relations were on the political agenda when the governments of Uzbekistan and Turkmenistan signed a friendship treaty. The agreement provided for cooperation on water resources.

At the close of 2004, parliamentary elections were held in accordance with the provisions set forth in the 2002 referendum. Following previous trends, opposition parties were excluded. Official results showed that pro-presidential parties won the vast majority of seats.

In May 2005, a shooting by Uzbek soldiers took place in the eastern city of Andijan where thousands of protestors had gathered. Clashes had taken place the night before between protestors and security forces. Then the next day, when troops opened fired on the crowds, hundreds of people were reported to have been killed. According to the government, the majority of those killed were militants. Eye witness versions on the ground had a different account of the events and claimed that many of the protestors who had been killed were unarmed civilians. Human rights organizations echoed this perspective and said that more than 500 civilians had been shot by Uzbek security forces.

The bloody scene occurred in the aftermath of a jailbreak in which thousands of prisoners were

freed. Although the thousands of prisoners who escaped included both petty criminals and the more hardened variety, the actual jailbreak had been spurred by a sense of anger regarding the imprisonment of several men accused of Islamic extremism.

The demonstrations gained momentum partially as a result of the jailbreak, but outrage and bitterness over the high rate of unemployment and the problems of poverty exacerbated tensions. Andijan in particular has been known as a center of anti-establishment sentiment. The government said it has been a hotbed of Islamic extremism. As such, the Ferghana valley, where Andijan is located, had been under surveillance by the authorities for some time. While these factors may well have characterized the situation in the city of Andijan, Uzbekistan as a whole has been under a rather autocratic regime in which media freedoms have been severely curtailed. Growing discontent over this constellation of factors may have contributed to the violent clashes.

The protestors had gathered in the streets and main city square, eventually taking control of several buildings in the area, including the mayor's office. As they convened in the streets to protest, protestors called for "justice" and "freedom." Their activities, however, resulted in the arrival of armored trucks with Uzbek troops who then opened fire on the crowds.

When the gunfire erupted around the area of the city's main square, intense panic and chaos spread as people tried to flee the scene. Protestors occupying the mayor's office returned fire and a 'shoot out' of sorts ensued. For its part, the government authorities blamed the protesters for the crisis, stating that they had rejected offers of compromise and used hostages strategically. But people on the streets accused the authorities of firing indiscriminately at protestors and others reported the sight of corpses in the ditches off the streets. A government helicopter was spotted in the sky above the bloody scene.

It was thought that President Karimov would travel to Andijan to try to bring some calm to the situation, however, he did not immediately make a public appearance. Protestors called for his resignation.

In neighboring countries, such as Tajikistan and Kyrgyzstan, the borders were sealed, however, a stream of Uzbeks apparently tried to cross the borders anyway.

Meanwhile, after critics noted that the United States had said very little about the events in Uzbekistan, on May 16, 2005, the Bush administration finally declared that it was "deeply disturbed" by the reports that Uzbek troops had fired on unarmed civilians. For some, these comments did not go far enough in condemning the actions of the troops. In fact, these critics pointed to the way in which a United States government spokesperson, Richard Boucher, appeared to have blamed the protestors for storming some of the buildings, even as he stated that stability in Uzbekistan was dependent on the rule of law.

Months after the incident, a trial was convened of the 15 apparent "terrorist organizers" of the demonstrations. According to the Uzbek government, the three men led a revolt, which led to the deaths of several hundred civilians when security forces fired on the crowd. The government's argument has been that the 15 defendants incited the mass protests which ended in bloodshed for hundreds of people. The 15 men pled guilty of charges that they was trying to overthrow the government in order to establish an Islamic state.

The government's case, however, was marred by a contradictory account by an Uzbek woman who said that government troops had opened fired on unarmed civilians, even as they waved white flags denoting "surrender." Makhbuba Zakirova's testimony so intensely undermined the argument made by the government that the prosecutor interrupted her to inquire if she was certain of what she was saying. Asking if the prosecutor intended to arrest her, Zakirova confirmed that she was simply speaking the truth.

The trial of the 15 men ended with a guilty verdict for each of the individuals. They were given sentences of between 14 and 20 years in jail. International observers dismissed the trial as a farce since the confessions of the men had been forced, thanks to the use of psychotropic drugs and beatings.

The issue of political dissent continued in early 2006. Sanjar Umarov, the leader of the opposition group Sunshine Uzbekistan and a business entrepreneur, was scheduled to go on trial on Jan. 30, 2006. The Uzbek opposition leader was arrested in 2005 for alleged embezzlement, money laundering and other economic crimes presumably to do with his business enterprises. His supporters claimed that the charges were politically motivated. Until the trial date, he was held in one of the prisons in Tashkent and was not allowed to make any public statements. After seeing him in jail, his lawyer said that Umarov was naked and incoherent, possibly a side-effect of mind-altering drugs.

Umarov gained notoriety in 2005 when, as aforementioned, protestors in the streets of Andijan were shot and killed by Uzbek authorities. Indeed, it had been Umarov's opposition group, Sunshine Uzbekistan, which dared to challenge the policies of President Karimov. Umarov's challenge to the government did not end there, however. His group also called for free-market reforms and criticized the government for over-centralization and corruption.

Such challenges have not been well-received by the government. In fact, the Karimov government detained and jailed opposition figures and dissenting voices 10 years prior and since then, Umarov's group has been one of few willing to express dissent or criticism of those in power. Umarov was arrested after writing a letter to parliament calling for a debate on possible political and economic reforms.

In March 2006, Umarov was sentenced to 10 years in jail. His situation laid bare the deteriorating

political scene in Uzbekistan, in which the ruling regime had grown more autocratic, and in which dissent and opposing voices were summarily silenced.

Also in March 2006, the climate of human rights in Uzbekistan turned inhospitable when the government ordered the refugee agency of the United Nations to close down its operations and exit the country within a month. The Uzbek government said that the agency, which had operated in the country since 1993, had fulfilled its role.

In May 2006, the group Human Rights Watch called on the international community to make the government of Uzbekistan accountable for its actions in Andijan. Human Rights Watch Director Kenneth Roth said, "The Uzbek government has done nothing to hold the perpetrators of this atrocity accountable, and the international community has failed to compel the Uzbek authorities do so. The victims deserve no less than full justice." The human rights group also called on the United States and the European Union specifically to increase the sanctions that had been imposed on Uzbekistan's leadership as a result of the violent crackdown. Subsequently, the State Department in the United States called for an inquiry into the massacre of Andijan. But Uzbek President Islam Karimov systematically rejected calls for an inquiry into what happened. He has maintained the view that Islamic militants were responsible for what transpired in Andijan.

Meanwhile, there was a general climate of fear and anxiety in Uzbekistan a year after the killings in Andijan, resulting in some degree of an exodus of Uzbeks who fled to other countries in the region. Such people feared that they would also be linked with what transpired in Andijan, and thus face detainment. But others had fled the country earlier, when the killings took place, and have not wanted to return out of generalized anxiety over the violence of that day. Some of these Uzbeks were returned to their home country in 2006 from Ukraine, Kazakhstan and Kyrgyzstan, in direct contravention of international law, which prohibits the extradition of political refugees in such a way, especially if resettlement destinations had been secured -- as was the case for some of the refugees. The United Nations cautioned that the return of such refugees would lead to their torture, despite the Uzbek government's claim to the contrary.

Within this context, there was a stronger call for diplomatic action against the government of Uzbekistan. To this end, the International Crisis Group urged the European Union to intensify its sanctions against Uzbekistan. Other Western countries said that they would consider instituting new sanctions against Uzbekistan authorities. By the close of 2006, the European Union announced that it would renew its sanctions, which included an arms embargo and a travel ban on Uzbek officials. However, the European body said that it would enter into talks with the Karimov government, which it claimed was trying to deal with the growing chorus of international consternation over its repressive policies.

By the spring of 2007, the landscape in Uzbekistan appeared to be as bleak as ever. An activist, reportedly employed with the group, Human Rights Watch, was sentenced to seven years in jail for

the dissemination of publications deemed to be both inflammatory and threatening to public order. Umida Niazova -- the 15th human rights activist to be jailed in Uzbekistan -- was also found guilty of smuggling and crossing the border illegally. Human Rights Watch accused the government of pursuing the charges for political reasons, and suggested that Niazova's treatment was motivated by the work done by human rights agencies at the time of the Andijan massacre. In the same period, Gulbahor Turayeva, a human rights activist from Andijan, was sentenced to six years in jail for slander, anti-constitutional activities, and distributing materials also deemed to be threatening to public order.

The start of November 2007 saw the United States-based human rights organization, Committee to Protect Journalists (CPJ), demand a complete inquiry into the murder of Uzbek journalist, Alisher Saipov, close to the Uzbek border in Kyrgyzstan a week prior. Members of CPJ conveyed their concerns to the Kyrgyz ambassador to the United States and suggested the possibility that Uzbek agents could have been involved in Saipov's killing. For its part, Kyrgyz security forces said that they had identified those thought to be responsible and were actively seeking to detain them. Meanwhile, at the international level, the European Union (EU) condemned Saipov's murder and in a statement asserted the following: "The EU urges the Kyrgyz authorities to hold an immediate and thorough investigation into the death of Mr. Saipov, arrest the perpetrators of this act and bring them to justice." Saipov gained notoriety for his journalistic independence and his willingness to expressly criticize the Uzbek government.

Late 2007 saw Uzbek President Islam Karimov re-elected with a resounding 88.1 percent of vote, according to early results announced by the country's Central Election Commission. Three opponents each garnered only about three percent of the vote share respectively. Karimov thusly secured a new seven-year term. International monitors were apparently in the country to observe the election and deemed the poll to be rife with fraud and ultimately a failure in meeting international standards. Indeed, the Organization for Security and Co-operation in Europe (OSCE), noted that said the election had been held in a controlled environment with no real opposition. The president did little campaigning on his own behalf, and his three unknown rivals spoke about his successful stewardship of the economy. They also refrained from asking Uzbeks to vote for them.

Meanwhile, despite the fact that the president is legally barred from pursuing a third term in office, there seemed to be no resistance to his contesting the election and no official rationale offered as to why his candidacy or his victory were constitutional. Western countries, quick to point out fraud in other parts of the world, have been oddly silent in their criticism of the inexplicable situation in Uzbekistan.

The following period was dominated by charges that the Uzbek authorities were moving in an increasingly autocratic direction. Notably, in July 2008, a representative from the human rights advocacy group, Human Rights Watch, was expelled from the country. Earlier, Igor Vorontsov had

been denied accreditation on the grounds that he was unfamiliar with the mentality of the Uzbek people and thus was unable to adequately assess the situation on the ground. Accordingly, Human Rights Watch issued a statement charging that Tashkent not only failed to make progress toward meeting the demands by the European Union for human rights reform, but instead it had actually regressed in several areas. At issue was Uzbekistan's call for an end to sanctions by the European Union following the 2005 Andijan massacre. This development flew directly in the face of key demands at stake, such as the release of human rights advocates and the accreditation of human rights representatives.

Another issue came to the fore in early 2009 when an Uzbek court sentenced five Islamic newspaper writers to jail time on the basis of their presumed guilt over the incitement of religious extremism.

But the first part of the year 2009 was also marked by President Karimov's move to allow the United States to transport military supplies through Uzbek territory to troops in Afghanistan, where the fight against Islamic militants -- known as the Taliban -- was ongoing.

Elections were held on Dec. 27, 2009, and Jan. 10, 2010, in Uzbekistan. At stake were the 150 seats in the Legislative Chamber of Uzbekistan, or the Oliy Majlis. Of these, 135 were elected directly from single member constituencies using a two-round system, and 15 seats were reserved for the Ecological Movement. The Central Election Commission official said turnout for the country's general elections in Uzbekistan exceeded 57 percent of the electorate and that the vote count was therefore valid as it crossed the 33 percent threshold. The commission also noted that the vote was monitored not only by representatives of the political parties, but also by international observers. However, the Organization for Security and Cooperation in Europe (OSCE) refused to send a full mission in response to the fact that none of its recommendations had been implemented ahead of the elections.

Following the two rounds of voting, results showed that the Uzbekistan Liberal Party won the largest number of seats in the legislative chamber and was reconfirmed as the dominant party with 55 deputies winning office. The People's Democratic Party of Uzbekistan won 32 seats; the Uzbekistan Revival Democratic Party won 31 seats; the Justice Social Democratic Party won 19 seats.

The next parliamentary elections were set to be held in Uzbekistan on Dec. 21, 2014. Parliamentary elections were set to be held in Uzbekistan on Dec. 21, 2014. In Uzbekistan, the legislative branch of government is a bicameral Supreme Assembly or "Oliy Majlis," which consists of an upper house or Senate (100 seats; 84 members are elected by regional governing councils to serve five-year terms and 16 are appointed by the president) and a lower house or Legislative Chamber (150 seats; 135 members elected by popular vote to serve five-year terms, while 15 spots reserved for the new Ecological Movement of Uzbekistan.

In these parliamentary elections of 2014, the political action would be in the lower house or Legislative Chamber, where the outcome would be decided by popular vote. The previous elections were held in late 2009 and early 2010 and were won by the Liberal Democratic Party of Uzbekistan. The People's Democratic Party of Uzbekistan and the National Rebirth Party enjoyed respectable performances at the polls and garnered the second most and third most seats in the lower house. Justice (Adolat) Social Democratic Party of Uzbekistan also gained representation in that body with a fourth place finish.

In 2014, the main political parties likely to contest the elections included the Liberal Democratic Party of Uzbekistan (O'zbekiston Liberal-Demokratik Partiyasi) or LDPU, the People's Democratic Party of Uzbekistan (Xalq Demokratik Partiyasi) or NDP, National Rebirth Democratic Party of Uzbekistan, Justice (Adolat) Social Democratic Party of Uzbekistan, and the Ecological Movement of Uzbekistan (O'zbekiston Ekologik Harakati).

Note: The outcome of the elections was not much of a mystery since the four main parties contesting the election (LDPU, NDP, National Rebirth, and Adolat) also supported President Islam Karimov. The Organization for Security and Cooperation in Europe (OSCE), which monitors elections in the region, criticized Uzbekistan's election exercise for being bereft of real competition. Daan Everts, the head of the OSCE election monitoring mission, said in a statement that Uzbekistan's parliamentary elections "were competently administered but lacked genuine electoral competition and debate." He added, "More comprehensive steps are needed to provide voters with real electoral choices."

The next presidential election was set for 2015. The specific date scheduled for elections to be held in Uzbekistan was March 29, 2015.

The incumbent president was long-serving Islom (or Islam) Abduganievich Karimov, who became the leader of Uzbekistan in 1991 when it was a Soviet republic. After gaining independence in 1991, Uzbekistan continued to be led by Karimov, the former First Secretary of the Communist Party, who was elected to power of the sovereign country. Under terms of a December 1995 referendum, Karimov's first term was extended to 2000. Another national referendum was held Jan. 27, 2002, to yet again extend Karimov's term. Under the aegis of that referendum, it was made clear that the president would be elected for a seven-year term by popular vote. The vote was ratified and Karimov's term was extended to December 2007. The last elections were held in December 2007, and overwhelmingly won by Karimov with more than 88 percent of the vote share. Now, in 2015, the presidential contest was set to be revisited as Uzbek citizens once again would head to the polls.

Given the strong performance of the parties loyal to the president in parliamentary elections in December 2014, there was little doubt that Karimov would be re-elected and extend his 25-year

long grip on power. The only fly in the proverbial ointment was the constitutional limit on him serving another term in office. While Karimov was nominated to be the main candidate of the Liberal Democratic Party of Uzbekistan (O'zbekiston Liberal-Demokratik Partiyasi) or LDPU, the fact of the matter was that Karimov was constitutionally ineligible for a fifth term. There were serious questions as to how this legal hurdle would be cleared. But on Jan. 19, 2015, electoral officials in Uzbekistan cleared the way for Karimov and two other candidates to contest the presidential election.

Of note was the fact that Karimov would be challenged by a handful of individuals, the most significant of whom was the chairman of Uzbekistan's People's Democratic Party -- Khatamjan Ketmonov. The other candidates included Narimon Umarov of the Social Democratic Adolat (Justice) party, and Akmal Saidov of the Democratic National Renaissance Party.

Also of note was a constitutional change made in 2011 reducing presidential terms from seven years to five years. .

In truth the outcome of the presidential election in Uzbekistan appeared to be a foregone conclusion. In late 2014, a headline on Fergananews.com website about the March 2015 Uzbek presidential election read as follows: "Incumbent President Islam Karimov's Reelection Scheduled For March 2015." This was an effective declaration of inevitability for Karimov -- the strongman leader of Central Asia.

Note: On election day in March 2015, after voters went to the polls and the ballots were counted, as expected, incumbent President Islam Karimov easily won another five years in office with an overwhelming 90 percent of the vote share. International monitors dismissed the election as a non-competitive exercise; however, Russian President Vladimir Putin viewed Karimov's victory as good news, issuing a congratulatory message that the outcome was proof of Karimov's "high authority among his compatriots."

Foreign Relations/Global Security Note

FBI arrests two Uzbeks and one Kazakh national of seeking to join Islamic State and plotting to kill President Obama

In the last week of February 2015, the Federal Bureau of Investigation (FBI) in United States arrested and charged three foreign nationals with conspiracy to provide material support to a foreign terrorist organization. According to the criminal complaint, the three men sought to join the notorious terror group, Islamic State. The criminal complaint also alleged that the three men had determined that if they were unable to travel to Syria to join Islamic State, they would shift their focus and carry out attacks in the United States, including the attempted assassination of President

Barack Obama.

The men -- Abdurasul Juraboev and Abror Habibov of Uzbekistan, and Akhror Saidakhmetov of Kazakhstan, came to the attention of federal authorities due to their postings on a Uzbek language website. Federal agents said that Juraboev purchased an airplane ticket to travel from New York to Istanbul, presumably with the intent of traveling on to Syria where he intended to join Islamic State. But Juraboev was also accused of conspiring to carry out the possible assassination of the United States leader, as illustrated by his posting to an Uzbek-language website, which read as follows: "I am in USA now but we don't have any arms. But is it possible to commit ourselves as dedicated martyrs anyway while here? What I'm saying is, to shoot Obama and then get shot ourselves, will it do? That will strike fear in the hearts of infidels." Meanwhile, Saidakhmetov was likewise accused of intending to join the notorious terror group, while also plotting attacks on the United States homeland. In a conversation with an informant, Saidakhmetov was reported to have said, "We will go and purchase one handgun ... then go and shoot one police officer. Boom ... Then we will go the FBI headquarters, kill the FBI People." Saidakhmetov was arrested at John F Kennedy International Airport in New York as he tried to board a flight bound for Turkey, allegedly en route to Syria where he would join Islamic State. The charges against Habibov involved providing material assistance to Saidakhmeto.

Each of the three defendants, if convicted, faced a maximum sentence of 15 years in prison. In her announcement of the arrests, United States Attorney for the Eastern District of New York, Loretta Lynch, warned that the threat of foreign nationals posing a threat to the United States and its allies was a growing one. Lynch, who was President Obama's nominee to replace outgoing Eric Holder as the United States new attorney general, said, "The flow of foreign fighters to Syria represents an evolving threat to our country and to our allies."

-- January 2016

Political Risk Index

Political Risk Index

The **Political Risk Index** is a proprietary index measuring the level of risk posed to governments, corporations, and investors, based on a myriad of political and economic factors. The [Political Risk Index](#) is calculated using an established methodology by CountryWatch's Editor-in-Chief and is based on varied criteria* including the following consideration: political stability, political representation, democratic accountability, freedom of expression, security and crime, risk of conflict, human development, jurisprudence and regulatory transparency, economic risk, foreign investment considerations, possibility of sovereign default, and corruption. Scores are assigned from 0-10 using the aforementioned criteria. A score of 0 marks the highest political risk, while a score of 10 marks the lowest political risk. Stated differently, countries with the lowest scores pose the greatest political risk. A score of 0 marks the most dire level of political risk and an ultimate nadir, while a score of 10 marks the lowest possible level of political risk, according to this proprietary index. Rarely will there be scores of 0 or 10 due to the reality that countries contain complex landscapes; as such, the index offers a range of possibilities ranging from lesser to greater risk.

*Methodology

The [Political Risk Index](#) is calculated by CountryWatch's Editor-in-Chief and is based on the combined scoring of varied criteria as follows --

1. political stability (record of peaceful transitions of power, ability of government to stay in office and carry out policies as a result of productive executive-legislative relationship, perhaps with popular support vis a vis risk of government collapse)
2. political representation (right of suffrage, free and fair elections, multi-party participation, and influence of foreign powers)
3. democratic accountability (record of respect for political rights, human rights, and civil liberties, backed by constitutional protections)
4. freedom of expression (media freedom and freedom of expression, right to dissent or express political opposition, backed by constitutional protections)

5. security and crime (the degree to which a country has security mechanisms that ensures safety of citizens and ensures law and order, without resorting to extra-judicial measures)
6. risk of conflict (the presence of conflict; record of coups or civil disturbances; threat of war; threats posed by internal or external tensions; threat or record of terrorism or insurgencies)
7. human development (quality of life; access to education; socio-economic conditions; systemic concern for the status of women and children)
8. jurisprudence and regulatory transparency (the impartiality of the legal system, the degree of transparency within the regulatory system of a country and the durability of that structure)
9. economic conditions (economic stability, investment climate, degree of nationalization of industries, property rights, labor force development)
10. corruption (the degree of corruption in a country and/or efforts by the government to address graft and other irregularities)

Editor's Note:

As of 2015, the current climate of upheaval internationally -- both politically and economically -- has affected the ratings for several countries across the world.

North Korea, [Afghanistan](#), [Somalia](#), and [Zimbabwe](#) -- retain their low rankings.

Several Middle Eastern and North African countries, such as [Tunisia](#), [Egypt](#), [Libya](#), [Syria](#), [Iraq](#) and [Yemen](#) were downgraded in recent years due to political instability occurring in the "season of unrest" sweeping the region since 2011 and continuing today. The worst downgrades affected [Syria](#) where civil war is at play, along with the rampage of terror being carried out by Islamist terrorists who have also seized control over part of Syrian territory. [Iraq](#) has been further downgraded due to the rampage of Islamist terrorists and their takeover of wide swaths of Iraqi territory. [Libya](#) has also been downgraded further due to its slippage into failed state status; at issue in [Libya](#) have been an ongoing power struggle between rival militias. [Yemen](#) continues to hold steady with a poor ranking due to continued unrest at the hands of Houthi rebels, secessionists, al-Qaida in the Arabian Peninsula, and Islamic State. Its landscape has been further complicated by the fact that it is now the site of a proxy war between [Iran](#) and [Saudi Arabia](#). Conversely, [Tunisia](#) and [Egypt](#) have seen slight upgrades as these countries stabilize.

In Africa, [Zimbabwe](#) continues to be one of the bleak spots of the world with the Mugabe regime

effectively destroying the country's once vibrant economy, and mirroring [Zimbabwe](#) with an exceedingly high rate of inflation, debilitating unemployment, devolving public services, and critical food shortages; rampant crime and political oppression round out the landscape. [Somalia](#) also sports a poor ranking due to the continuing influence of the terror group, al-Shabab, which was not operating across the border in [Kenya](#). On the upside, [Nigeria](#), which was ineffectively dealing with the threat posed by the terror group, Boko Haram, was making some strides on the national security front with its new president at the helm. [Mali](#) was slightly upgraded due to its efforts to return to constitutional order following the 2012 coup and to neutralize the threat of separatists and Islamists. But the [Central African Republic](#) was downgraded due to the takeover of the government by Muslim Seleka rebels and a continued state of lawlessness in that country. South [Sudan](#) -- the world's newest nation state -- has not been officially included in this assessment; however, it can be unofficially assessed to be in the vicinity of "3" due to its manifold political and economic challenges. [Burkina Faso](#), [Burundi](#) and [Guinea](#) have been downgraded due to political unrest, with [Guinea](#) also having to deal with the burgeoning Ebola crisis.

In Europe, [Ukraine](#) was downgraded due to the unrest facing that country following its Maidan revolution that triggered a pro-Russian uprising in the eastern part of the country. [Russia](#) was also implicated in the Ukrainian crisis due to its intervention on behalf of pro-Russian separatists, as well as its annexation of the Ukrainian territory of Crimea. Strains on the infrastructure of southern and eastern European countries, such as [Serbia](#), [Croatia](#), and [Hungary](#), due to an influx of refugees was expected to pose social and economic challenges, and slight downgrades were made accordingly. So too, a corruption crisis for the Romanian prime minister has affected the ranking of that country. Meanwhile, the rankings for [Spain](#), [Portugal](#), [Ireland](#), and [Italy](#) were maintained due to debt woes and the concomitant effect on the euro zone. [Greece](#), another euro zone nation, was earlier downgraded due to its sovereign debt crisis; however, no further downgrade was added since the country was able to successfully forge a bailout rescue deal with creditor institutions. Cyprus' exposure to Greek banks yielded a downgrade in its case.

In Asia, [Nepal](#) was downgraded in response to continuous political instability and a constitutional crisis that prevails well after landmark elections were held. Both [India](#) and China retain their rankings; [India](#) holds a slightly higher ranking than [China](#) due to its record of democratic representation and accountability. Increasing violence and political instability in [Pakistan](#) resulted in a downgrade for this country's already low rating. Meanwhile, [Singapore](#) retained its strong rankings due to its continued effective stewardship of the economy and political stability.

In the Americas, ongoing political and economic woes, as well as crime and corruption have affected the rankings for [Mexico](#), [Guatemala](#), and [Brazil](#). [Argentina](#) was downgraded due to its default on debt following the failure of talks with bond holders. [Venezuela](#) was downgraded due to its mix of market unfriendly policies and political oppression. For the moment, the [United States](#) maintains a strong ranking along with [Canada](#), and most of the English-speaking countries of the Caribbean; however, a renewed debt ceiling crisis could cause the [United States](#) to be downgraded

in a future edition. Finally, a small but significant upgrade was attributed to [Cuba](#) due to its recent pro-business reforms and its normalization of ties with the United States.

***Methodology**

The Political Stability Index is calculated by CountryWatch's Editor-in-Chief and is based on the combined scoring of varied criteria as follows --

1. record of peaceful transitions of power (free and fair elections; adherence to political accords)
2. record of democratic representation, presence of instruments of democracy; systemic accountability
3. respect for human rights; respect for civil rights
4. strength of the system of jurisprudence, adherence to constitutional order, and good governance
5. ability of a government to stay in office and carry out its policies vis a vis risk credible risks of government collapse (i.e. government stability versus a country being deemed "ungovernable")
6. threat of coups, insurgencies, and insurrection
7. level of unchecked crime and corruption
8. risk of terrorism and other threats to national security
9. relationship with regional powers and international community; record of bilateral or multilateral cooperation
10. degree of economic strife (i.e. economic and financial challenges)

Editor's Note:

As of 2015, the current climate of upheaval internationally -- both politically and economically -- has affected the ratings for several countries across the world. The usual suspects -- North Korea, [Afghanistan](#), and [Somalia](#) -- retain their low rankings. The reclusive and ultra-dictatorial North Korean regime, which has terrified the world with its nuclear threats, has exhibited internal instability. Of note was a cut-throat purge of hundreds of high ranking officials deemed to be a threat to Kim Jung-un. Despite their attempts to recover from years of lawlessness, war, and warlordism, both [Afghanistan](#) and [Somalia](#) continue to be beset by terrorism and turmoil. In [Afghanistan](#), while international forces have seen success in the effort against the terror group, al-Qaida, the other Islamist extremist group, the Taliban, continues to carry out a vicious insurgency using terrorism. In [Somalia](#), while the government attempts to do the nation's business, the terror group, al-Shabab continues to make its presence known not only in [Somalia](#), but across the border into [Kenya](#) with devastating results/ Also in this category is [Iraq](#), which continues to be rocked by horrific violence and terrorism at the hands of Islamic State, which has taken over wide swaths of Iraqi territory.

Syria, [Libya](#), and [Yemen](#) have been added to this unfortunate echelon of the world's most politically unstable countries. [Syria](#) has been mired by the twin hazards of 1. a civil war as rebels oppose the Assad regime; and 2. the rampage of terror being carried out by Islamic State, which also seized control over vast portions of Syrian territory. Meanwhile, the post-Qaddhafi landscape of [Libya](#) has devolved into chaos as rival militias battle for control -- the elected government of the country notwithstanding. Rounding out this grim triad is [Yemen](#), which was dealing with a Houthi rebellion, secessionists in the south, as well as the threat of terrorism from al-Qaida in the Arabian Peninsula as well as Islamic State, while also being the site of a proxy war between Shi'a [Iran](#) and Sunni [Saudi Arabia](#).

Meanwhile, several Middle Eastern and North African countries, such as [Tunisia](#), [Egypt](#), and [Bahrain](#) were downgraded in recent years due to political instability occurring in the "season of unrest" sweeping the region since 2011 and continuing today. All three of these countries have stabilized in recent years and have been upgraded accordingly. In [Bahrain](#), the landscape had calmed. In [Egypt](#), the secular military-backed government has generated criticism for its crackdown on the Muslim Brotherhood; however, the country had ratified the presidency via democratic elections and were on track to hold parliamentary elections as the country moved along the path of democratization. Perhaps the most impressive story was coming out of [Tunisia](#) -- the country whose Jasmine Revolution sparked the entire Arab Spring -- and where after a few years of strife, a new progressive constitution was passed into law and a secular government had been elected to power. [Tunisia](#), [Egypt](#), and [Bahrain](#) have seen slight upgrades as these countries stabilize.

In Africa, the [Central African Republic](#) was downgraded the previous year due to the takeover of the government by Muslim Seleka rebels. Although the country has been trying to emerge from this crisis, the fact of the matter was that it was difficult to halt the precipitous decline into lawlessness in that country. [Zimbabwe](#) has maintained its consistently poor ranking due to the dictatorial regime of Mugabe, who continues to hold a tight grip on power, intimidates the opposition, squashes dissent, and oppresses the white farmer population of the country. Moving in a slightly improved direction is [Nigeria](#), which has sported abysmal ratings due to the government's fecklessness in dealing with the threat posed by the Islamist terror group, Boko Haram. Under its newly-elected government, there appears to be more of a concerted effort to make national security a priority action item. [Mali](#) was also slightly upgraded due to its efforts to return to constitutional order following the 2012 coup and to neutralize the threat of separatists and Islamists. Political instability has visited [Burkina Faso](#) and [Burundi](#) as the leaders of those countries attempted to side-step constitutional limits to hold onto power. In [Burundi](#), an attempted coup ensued but quelled, and the president won a (questionable) new term in office; unrest has since punctuated the landscape. In [Burkina Faso](#), the political climate has turned stormy as a result of a successful coup that ended the rule of the president, and then a putsch against the transitional government. These two African countries have been downgraded as a result.

It should be noted that the African country of South [Sudan](#) -- the world's newest nation state -- has not been officially included in this assessment; however, it can be unofficially assessed to be in the vicinity of "3" due to its manifold political and economic challenges. [Guinea](#) has endured poor rankings throughout, but was slightly downgraded further over fears of social unrest and the Ebola health crisis.

In Europe, [Ukraine](#) was downgraded due to the unrest facing that country following its Maidan revolution that triggered a pro-Russian uprising in the eastern part of the country. [Russia](#) was also implicated in the Ukrainian crisis due to its intervention on behalf of pro-Russian separatists, as well as its annexation of the Ukrainian territory of Crimea. [Serbia](#) and [Albania](#) were slightly downgraded due to eruptions of unrest, while [Romania](#) was slightly downgraded on the basis of corruption charges against the prime minister. [Spain](#), [Portugal](#), [Ireland](#), and [Italy](#) were downgraded due to debt woes and the concomitant effect on the euro zone. [Greece](#), another euro zone nation, was downgraded the previous year due to its sovereign debt crisis; however, the country successfully forged a rescue deal with international creditors and stayed within the Euro zone. Greek voters rewarded the hitherto unknown upstart party at the polls for these efforts. As a result, [Greece](#) was actually upgraded slightly as it proved to the world that it could endure the political and economic storms. Meanwhile, [Germany](#), [France](#), [Switzerland](#), the [United Kingdom](#), the [Netherlands](#), and the Scandinavian countries continue to post impressive ranking consistent with these countries' strong records of democracy, freedom, and peaceful transfers of power.

In Asia, [Nepal](#) was downgraded in response to continuous political instability well after landmark elections that prevails today. [Cambodia](#) was very slightly downgraded due to post-election instability that has resulted in occasional flares of violence. Despite the "trifecta of tragedy" in [Japan](#) in 2011 -- the earthquake, the ensuing tsunami, and the resulting nuclear crisis -- and the appreciable destabilization of the economic and political terrain therein, this country has only slightly been downgraded. Japan's challenges have been assessed to be transient, the government remains accountable, and there is little risk of default. Both [India](#) and China retain their rankings; [India](#) holds a slightly higher ranking than [China](#) due to its record of democratic representation and accountability. Increasing violence and political instability in [Pakistan](#) resulted in a downgrade for this country's already low rating.

In the Americas, [Haiti](#) retained its downgraded status due to ongoing political and economic woes. [Mexico](#) was downgraded due to its alarming rate of crime. [Guatemala](#) was downgraded due to charges of corruption, the arrest of the president, and uncertainty over the outcome of elections. [Brazil](#) was downgraded due to the corruption charges erupting on the political landscape, the stalling of the economy, and the increasingly loud calls for the impeachment of President Rousseff. [Argentina](#) was downgraded due to its default on debt following the failure of talks with bond holders. [Venezuela](#) was downgraded due to the fact that the country's post-Chavez government is every bit as autocratic and nationalistic, but even more inclined to oppress its political opponents. [Colombia](#) was upgraded slightly due to efforts aimed at securing a peace deal

with the FARC insurgents. A small but significant upgrade was attributed to [Cuba](#) due to its recent pro-business reforms and its normalization of ties with the United States. Meanwhile, the [United States](#), [Canada](#), [Costa Rica](#), [Panama](#), and most of the English-speaking countries of the Caribbean retain their strong rankings due to their records of stability and peaceful transfers of power.

In the Pacific, [Fiji](#) was upgraded due to its return to constitutional order and democracy with the holding of the first elections in eight years.

In Oceania, [Maldives](#) has been slightly downgraded due to the government's continued and rather relentless persecution of the country's former pro-democracy leader - former President Nasheed.

Freedom Rankings

Freedom Rankings

Freedom in the World

Editor's Note: This ranking by Freedom House quantifies political freedom and civil liberties into a single combined index on each sovereign country's level of freedom and liberty. The initials "PR" and "CL" stand for Political Rights and Civil Liberties, respectively. The number 1 represents the most free countries and the number 7 represents the least free. Several countries fall in the continuum in between. The freedom ratings reflect an overall judgment based on survey results.

Country	PR	CL	Freedom Status	Trend Arrow
Afghanistan	6 ?	6	Not Free	
Albania*	3	3	Partly Free

Methodology:

PR and CL stand for political rights and civil liberties, respectively; 1 represents the most free and 7 the least free rating. The ratings reflect an overall judgment based on survey results.

? ? up or down indicates a change in political rights, civil liberties, or status since the last survey.

↑ ↓ up or down indicates a trend of positive or negative changes that took place but that were not sufficient to result in a change in political rights or civil liberties ratings of 1-7.

* indicates a country's status as an electoral democracy.

Human Rights

Overview of Human Rights in Uzbekistan

High levels of unemployment and poverty, corruption and an unstable economic situation negatively impact Uzbekistan's already dismal human rights record.

These factors contributed to the Andijan events in May 2005. Between February and May 2005, peaceful protests supporting men on trial for Islamic extremism occurred. On the night of May 12, 2005, citizens stole weapons from the police garrison and stormed the city prison where the defendants were being held. Several hundred prisoners also escaped during this time. On the evening of May 13, 2005, in retribution for the actions of the night before, government forces began firing into the demonstrators who were protesting injustice and economic hardship. It is estimated that between 150 to 700 people were killed, many of these while fleeing the scene.

The government has characterized this incident as an Islamic extremist attempt to overthrow the government. Consequently, the Uzbek government also detained between several hundred and several thousands of individuals for the purpose of coercing testimony about the events in Andijan. The trial of the 15 defendants charged with crimes relating to the events was nowhere near acceptable by international standards. In the end, all 15 were convicted and sentenced to prison terms no longer than 20 years and no shorter than 14 years.

It should be noted that during the government's case, however, was marred by a contradictory account by an Uzbek woman who said that government troops had opened fired on unarmed civilians, even as they waved white flags denoting "surrender." Makhbuba Zakirova's testimony so intensely undermined the argument made by the government that the prosecutor interrupted her to inquire if she was certain of what she was saying. Asking if the prosecutor intended to arrest her, Zakirova confirmed that she was simply speaking the truth.

The issue of political dissent continued in early 2006. Sanjar Umarov, the leader of the opposition group Sunshine Uzbekistan and a business entrepreneur, was scheduled to go on trial on Jan. 30, 2006. The Uzbek opposition leader was arrested in 2005 for alleged embezzlement, money laundering and other economic crimes presumably to do with his business enterprises. His supporters claimed that the charges were politically motivated. After seeing him in jail, his lawyer said that Umarov was naked and incoherent, possibly a side-effect of mind-altering drugs. Umarov gained notoriety in 2005 when his opposition group dared to challenge the policies of President Karimov. In March 2006, Umarov was sentenced to 10 years in jail. His situation laid bare the deteriorating political scene in Uzbekistan, in which the ruling regime had grown more autocratic, and in which dissent and opposing voices were summarily silenced.

Also in March 2006, the climate of human rights in Uzbekistan turned inhospitable when the government ordered the refugee agency of the United Nations to close down its operations and exit the country within a month. The Uzbek government said that the agency, which had operated in the country since 1993, had fulfilled its role.

Since the massacre in Andijan, human rights defenders, independent journalists, and critics of the government have faced increased levels of surveillance, house arrest, arbitrary arrest and detention, and interference in their work. Some have been forced to flee the country for fear of persecution. The government also tightened restrictions on local non-governmental organizations (NGOs). It took steps which led to the closure of hundreds of NGOs cities around the country.

In 2007, an activist, reportedly employed with the group, Human Rights Watch, was sentenced to seven years in jail for the dissemination of publications deemed to be both inflammatory and threatening to public order. Umida Niazova -- the 15th human rights activist to be jailed in Uzbekistan -- was also found guilty of smuggling and crossing the border illegally. Human Rights Watch accused the government of pursuing the charges for political reasons, and suggested that Niazova's treatment was motivated by the work done by human rights agencies at the time of the Andijan massacre. In the same period, Gulbahor Turayeva, a human rights activist from Andijan, was sentenced to six years in jail for slander, anti-constitutional activities, and distributing materials also deemed to be threatening to public order.

In July 2008, a representative from the human rights advocacy group, Human Rights Watch, was

expelled from the country. Earlier, Igor Vorontsov had been denied accreditation on the grounds that he was unfamiliar with the mentality of the Uzbek people and thus was unable to adequately assess the situation on the ground. Accordingly, Human Rights Watch issued a statement charging that Tashkent not only failed to make progress toward meeting the demands by the European Union for human rights reform, but instead it had actually regressed in several areas. At issue was Uzbekistan's call for an end to sanctions by the European Union following the 2005 Andijan massacre. This development flew directly in the face of key demands at stake, such as the release of human rights advocates and the accreditation of human rights representatives.

Another issue came to the fore in early 2009 when an Uzbek court sentenced five Islamic newspaper writers to jail time on the basis of their presumed guilt over the incitement of religious extremism.

But the first part of the year 2009 was also marked by President Karimov's move to allow the United States to transport military supplies through Uzbek territory to troops in Afghanistan, where the fight against Islamic militants -- known as the Taliban -- was ongoing.

While the government did make positive steps in reducing the amount of human trafficking incidences recently, there are still many more reforms necessary before Uzbekistan will ever come close to having a fair human rights record.

*Human Development Index (HDI) is a composite index that measures the level of well-being in 177 nations in the world. It uses factors such as poverty, literacy, life-expectancy, education, gross domestic product, and purchasing power parity to assess the average achievements in each nation. It has been used in the United Nation's Human Development Report since 1993.

*Human Poverty Index Ranking is based on certain indicators used to calculate the Human Poverty Index. Probability at birth of not surviving to age 40, adult literacy rate, population without sustainable access to an improved water source, and population below income poverty line are the indicators assessed in this measure.

*The Gini Index measures inequality based on the distribution of family income or consumption. A value of 0 represents perfect equality (income being distributed equally), and a value of 100 perfect inequality (income all going to one individual).

*The calculation of the total crime rate is the % of the total population which has been effected by property crime, robbery, sexual assault, assault, or bribery (corruption) related occurrences.

Government Functions

Constitution

The government of the former Uzbek Soviet Socialist Republic operated under a constitution, approved in Moscow and ratified by the Uzbek Supreme Soviet, until 1991. This constitution made Uzbekistan a sovereign republic, but the real power remained in the Soviet Union. After Mikhail Gorbachev officially dissolved the Communist Party in 1991, Uzbekistan became an independent state on Sept. 1, 1991, and the political leadership began to draft a new constitution. Uzbekistan's Constitution, adopted on Dec. 8, 1992, provides for a presidential system with separation of powers, freedom of speech, and representative government. In 2002, the presidential term was extended from five years to seven years by constitutional amendment.

Executive Authority

The president of Uzbekistan is the head of state. The president is elected for a seven-year term and appoints, with parliamentary approval, all cabinet members and court justices. In 2002, the presidential term was extended from five years to seven years by constitutional amendment. Since most opposition parties are regularly banned from participating in presidential and parliamentary elections, presidential power is strong.

Legislative Authority

In January 2002, the government called for, and held, a nationwide referendum to create a bicameral legislature to be put into effect by the time of the 2004 parliamentary elections. Since that time, legislative authority has been vested in the bicameral Supreme Assembly or Oliy Majlis. This legislature consists of an Upper House or Senate, made up of 100 seats with 84 members elected by regional governing councils to serve five-year terms and 16 appointed by the president, and a Lower House or Legislative Chamber, made up of 120 seats with members elected by popular vote to serve five-year terms. The assembly can make constitutional amendments and approve cabinet and judicial appointments, and budget proposals.

Judicial Authority

The judiciary consists of the Constitutional Court, the Supreme Court and the Higher Economic Court.

Type:

Republic; effectively authoritarian presidential rule, with little power outside the executive branch; executive power concentrated in the presidency

Executive Branch:

Head of State:

President Islom (or Islam) Abduganievich KARIMOV (since 1990, when he was elected president by the then Supreme Soviet; elected president of independent Uzbekistan in 1991)

Note:

Karimov, former First Secretary of the Communist Party, was elected President in December 1991 with 88 percent of the vote. Under terms of a December 1995 referendum, Karimov's first term was extended to 2000. Another national referendum was held Jan. 27, 2002, to yet again extend Karimov's term. The referendum passed and Karimov's term was extended to December 2007. As a result of the referendum held on Jan. 27, 2002, the president is elected for a seven-year term by popular vote with last elections held in 2015, as noted below. Note that constitutional changes meant that a president's term would now be five years rather than seven years.

Primer on 2015 presidential election

(March 29, 2015)

A presidential election was set to be held in Uzbekistan on March 29, 2015

The incumbent president was long-serving Islom (or Islam) Abduganievich Karimov, who was became the leader of Uzbekistan in 1991 when it was a Soviet republic. After gaining independence in 1991, Uzbekistan continued to be led by Karimov, the former First Secretary of the Communist Party, who was elected to power of the sovereign country. Under terms of a December 1995 referendum, Karimov's first term was extended to 2000. Another national referendum was held Jan. 27, 2002, to yet again extend Karimov's term. Under the aegis of that referendum, it was made clear that the president would be elected for a seven-year term by popular vote. The vote was ratified and Karimov's term was extended to December 2007. The last

elections were held in December 2007, and overwhelmingly won by Karimov with more than 88 percent of the vote share. Now, in 2015, the presidential contest was set to be revisited as Uzbek citizens once again would head to the polls.

Given the strong performance of the parties loyal to the president in parliamentary elections in December 2014, there was little doubt that Karimov would be re-elected and extend his 25-year long grip on power. The only fly in the proverbial ointment was the constitutional limit on him serving another term in office. While Karimov was nominated to be the main candidate of the Liberal Democratic Party of Uzbekistan (O'zbekiston Liberal-Demokratik Partiyasi) or LDPU, the fact of the matter was that Karimov was constitutionally ineligible for a fifth term. There were serious questions as to how this legal hurdle would be cleared. But on Jan. 19, 2015, electoral officials in Uzbekistan cleared the way for Karimov and two other candidates to contest the presidential election.

Of note was the fact that Karimov would be challenged by a handful of individuals, the most significant of whom was the chairman of Uzbekistan's People's Democratic Party -- Khatamjan Ketmonov. The other candidates included Narimon Umarov of the Social Democratic Adolat (Justice) party, and Akmal Saidov of the Democratic National Renaissance Party.

Also of note was a constitutional change made in 2011 reducing presidential terms from seven years to five years.

In truth the outcome of the presidential election in Uzbekistan appeared to be a foregone conclusion. In late 2014, a headline on Fergananews.com website about the March 2015 Uzbek presidential election read as follows: "Incumbent President Islam Karimov's Reelection Scheduled For March 2015." This was an effective declaration of inevitability for Karimov -- the strongman leader of Central Asia.

Note: On election day in March 2015, after voters went to the polls and the ballots were counted, as expected, incumbent President Islam Karimov easily won another five years in office with an overwhelming 90 percent of the vote share. International monitors dismissed the election as a non-competitive exercise; however, Russian President Vladimir Putin viewed Karimov's victory as good news, issuing a congratulatory message that the outcome was proof of Karimov's "high authority among his compatriots."

Head of government:

Prime Minister Shavkat MIRZIYAYEV (since Dec. 11, 2003)

Cabinet:

Cabinet of Ministers; appointed by the president with the approval of the "Oli Majlis" (Supreme Assembly)

Legislative Branch:

Bicameral Supreme Assembly or "Oliy Majlis"

Consists of an Upper House or Senate (100 seats; 84 members are elected by regional governing councils to serve five-year terms and 16 are appointed by the president) and a Lower House or Legislative Chamber (150 seats; 135 members elected by popular vote to serve five-year terms, while 15 spots reserved for the new Ecological Movement of Uzbekistan)

Note:

In a nationwide referendum held on Jan. 27, 2002, the voters approved a switch to a bicameral legislature.

Elections:

Last held December 2009 and January 2010; next to be held in December 2014

Brief Note on 2009-2010 general elections

Senate - percent of vote by party - NA; seats by party - NA; Legislative Chamber - percent of vote by party - NA; seats by party - LDPU 53, NDP 32, National Rebirth Party 31, Adolat 19. Note that all parties in the Supreme Assembly support President KARIMOV.

Primer on 2014 parliamentary elections

Dec. 21, 2014 --

Parliamentary elections were set to be held in Uzbekistan on Dec. 21, 2014. In Uzbekistan, the legislative branch of government is a bicameral Supreme Assembly or "Oliy Majlis," which consists of an upper house or Senate (100 seats; 84 members are elected by regional governing councils to serve five-year terms and 16 are appointed by the president) and a lower house or Legislative Chamber (150 seats; 135 members elected by popular vote to serve five-year terms, while 15 spots reserved for the new Ecological Movement of Uzbekistan).

In these parliamentary elections of 2014, the political action would be in the lower house or Legislative Chamber, where the outcome would be decided by popular vote. The previous elections were held in late 2009 and early 2010 and were won by the Liberal Democratic Party of Uzbekistan. The People's Democratic Party of Uzbekistan and the National Rebirth Party enjoyed respectable performances at the polls and garnered the second most and third most seats in the lower house. Justice (Adolat) Social Democratic Party of Uzbekistan also gained representation in that body with a fourth place finish.

In 2014, the main political parties likely to contest the elections included the Liberal Democratic Party of Uzbekistan (O'zbekiston Liberal-Demokratik Partiyasi) or LDPU, the People's

Democratic Party of Uzbekistan (Xalq Demokratik Partiyas) or NDP, National Rebirth Democratic Party of Uzbekistan, Justice (Adolat) Social Democratic Party of Uzbekistan, and the Ecological Movement of Uzbekistan (O'zbekiston Ekologik Harakati).

Note: The outcome of the elections was not much of a mystery since the four main parties contesting the election (LDPU, NDP, National Rebirth, and Adolat) also supported President Islam Karimov. The Organization for Security and Cooperation in Europe (OSCE), which monitors elections in the region, criticized Uzbekistan's election exercise for being bereft of real competition. Daan Everts, the head of the OSCE election monitoring mission, said in a statement that Uzbekistan's parliamentary elections "were competently administered but lacked genuine electoral competition and debate." He added, "More comprehensive steps are needed to provide voters with real electoral choices."

Judicial Branch:

Supreme Court, judges nominated by the president and confirmed by the Supreme Assembly

Constitution:

Adopted Dec. 8, 1992; key amendment extending presidential terms passed in 2002

Legal System:

Based on Soviet civil law; still lacks independent judicial system

Administrative Divisions:

12 "wiloyatlar" (singular-wiloyat), one autonomous republic* (respublikasi), and one city** (shahri): Andijon Wiloyati, Bukhoro Wiloyati, Farghona Wiloyati, Jizzakh Wiloyati, Khorazm Wiloyati (Urganch), Namangan Wiloyati, Nawoiy Wiloyati, Qashqadaryo Wiloyati (Qarshi), Qoraqalpoghiston* (Nukus), Samarqand Wiloyati, Sirdaryo Wiloyati (Guliston), Surkhondaryo Wiloyati (Termiz), Toshkent Shahri**, Toshkent Wiloyati

Note:

An administrative division has the same name as its administrative center; exceptions have the administrative center name in parentheses.

Political Parties and Leaders:

Ecological Movement of Uzbekistan (O'zbekiston Ekologik Harakati) [Boriy ALIKHANOV]
Justice (Adolat) Social Democratic Party of Uzbekistan [Narimon UMAROV]

Liberal Democratic Party of Uzbekistan (O'zbekiston Liberal-Demokratik Partiyasi) or LDPU [Islam KARIMOV]

National Revival Democratic Party of Uzbekistan (O'zbekiston Milliy Tiklanish Demokratik Partiyasi) [Shavkat MIRZIYOYEV]

People's Democratic Party of Uzbekistan (Xalq Demokratik Partiyas) or NDP [Hotamjon KETMONOV] (formerly Communist Party)

Suffrage:

18 years of age; universal

Leader Biography

Leader Biography

President of Uzbekistan

Personal Data

Name: Islom Abduganievich Karimov

Date of Birth: Jan. 30, 1938

Place of Birth: Samarkand

Civil Status: Married

Children: Two daughters

Education

Central Asian Polytechnic

Tashkent Economics Institute

Previous Positions

1960-1966 Worked in Tashkent aviation construction factory

1964-1991 Member, Communist Party Soviet Union

1966-1983 Sr. specialist, head of section, Vice-Chair of Uzbekistan Gosplan

1983-1986 Minister of Finance, Deputy Chairman of Council of Ministers, Uzbek Soviet Socialist Republic

1986-1989 First Secretary, Kashkadarinsk District Committee

1989-1991 First Secretary, Central Committee Uzbek Communist Party

U.S.S.R. People's Deputy

1990 President, Uzbek Soviet Socialist Republic

1990-1991 Member, Central Committee Communist Party Soviet Union and Politburo

1991-1996 Chairman, People's Democratic Party of Uzbekistan

Present Positions

1991-Present President of Uzbekistan

Chairman of the Cabinet of Ministers

Honorary Chairman of the Fund of Friendship of Central Asia and Kazakhstan

Foreign Relations

General Relations

Uzbekistan is a member of the United Nations, the Euro-Atlantic Partnership Council, Partnership for Peace, the Organization on Security and Cooperation in Europe (OSCE), the Shanghai Cooperation Organization (SCO), the Collective Security Treaty Organization (CSTO), the Commonwealth of Independent States (CIS), NATO Partnership for Peace, the Organization of the Islamic Conference (OIC), and the Economic Cooperation Organization--comprised of the five

Central Asian countries, Azerbaijan, Turkey, Iran, Afghanistan, and Pakistan.

In 1999, Uzbekistan joined the GUAM alliance (Georgia, Ukraine, Azerbaijan, and Moldova), which was formed in 1997 (making it GUUAM), but formally withdrew in 2005. Uzbekistan hosts the Shanghai Cooperation Organization's (SCO) Regional Anti-Terrorist Structure (RATS) in Tashkent. Uzbekistan is a founding member of the Central Asian Union, formed with Kazakhstan and Kyrgyzstan (and which Tajikistan joined in March 1998). In 2002, Uzbekistan joined the Central Asian Cooperation Organization (CACO), which also includes Tajikistan, Kazakhstan, and Kyrgyzstan. In 2006, Uzbekistan joined the Eurasian Economic Community (EurASEC), comprising Belarus, Kazakhstan, Kyrgyzstan, Russia, Tajikistan, and Uzbekistan, but subsequently withdrew in 2008.

Uzbekistan joined the Commonwealth of Independent States in December 1991. Still, it is opposed to reintegration and withdrew from the CIS collective security arrangement in 1999. Since that time, Uzbekistan has participated in the CIS peacekeeping force in Tajikistan and in United Nations-organized groups to help resolve the Tajik and Afghan conflicts, both of which it sees as posing threats to its own stability.

Uzbekistan is a supporter of United States efforts against worldwide terrorism and joined the coalition combating terrorism in Afghanistan. It continues to support coalition anti-terrorist operations in Afghanistan by granting access to Germany to an air base in southern Uzbekistan.

Uzbekistan has actively participated in regional efforts to combat terrorism and the narcotics trade. It has maintained close ties to Russia, while also seeking to balance this with stronger ties to China and other powers.

Regional Relations

Regionally, religious extremism and drug-trafficking are plaguing relations with Uzbekistan's neighbors. The events of Sept. 11, 2001, in the United States and the resulting war on terrorism in Afghanistan have fundamentally given the Karimov government a new sense of urgency in dealing with the major Islamic fundamentalist groups operating throughout the region including the Islamic Movement of Uzbekistan (IMU) and the Hezb ut-Tahrir.

With respect to border issues there has been some progress made. Uzbekistan and Tajikistan are continuing to work on delimitating their frontier. The two countries signed in May 2000 an agreement on the delimitation of the state borders.

On Sept. 27, 2000, Uzbek President Islom Karimov visited neighboring Kyrgyz President Akayev during which they discussed the delimitation of the border between Uzbekistan and Kyrgyzstan.

In September 2002, Uzbekistan and Kazakhstan signed a bilateral agreement finalizing the border demarcation between the two countries.

In terms of regional economic projects there are numerous discussions on the transportation of energy across Central Asia's frontier as well as envisioned telecommunications projects. In the telecom arena, these countries situated along the historic Silk Road, stretching from the western frontier of China to Eastern Europe, are hoping that a proposed regional state-of-the-art satellite communications system would bring cooperation and stability to this troubled, vast multicultural expanse.

Presidents and foreign ministers of the countries attending the U.N. Millennium Summit in September 2000 placed their initials on their countries' locations on a global projection map, symbolizing their support for this bold endeavor. The countries represented at this Silk Road Cooperation Summit were: Armenia, Azerbaijan, Georgia, Kazakhstan, Kyrgyzstan, Moldova, Romania, Tajikistan, Turkmenistan, Uzbekistan and Ukraine.

The project is expected to build and launch a new-generation, small-sized telecommunications satellite, dedicated to the needs of the countries in the region. Among the benefits of the project would be reliable digital communications for governments, militaries and border security services.

Uzbekistan, until June 2002 was a member of the GUUAM (the initials standing for Georgia, Ukraine, Uzbekistan, Azerbaijan, and Moldova) political, economic and security alliance. The five participating GUUAM countries formalized the relationship by signing a charter on June 7, 2001, in Yalta, Ukraine. In it they acknowledge "that regional cooperation is a part of globalization processes, and may contribute to consolidation of sovereignty, independence and territorial integrity of the GUUAM member states, promote peaceful settlement of conflicts and improve well-being of their peoples."

In June 2002 Uzbek Foreign Minister Abdulaziz Kamilov announced the withdrawal of Uzbekistan from GUUAM giving no detailed explanation, but given the regional disparities amongst the five countries, it was not obvious what political or economic forces would keep the group together over time.

In November 2004, regional relations were on the political agenda when the governments of Uzbekistan and Turkmenistan signed a friendship treaty. The agreement provided for cooperation on water resources.

Other Significant Relations

Russia

Russian relations have been tense because of the large number of Russians living in Uzbekistan. Uzbekistan will not grant dual citizenship to these people, and many of them have returned to Russia. In February 2000, Uzbek President Karimov said that Uzbekistan would withdraw from the CIS' collective security treaty, a pillar of Russia's influence in the region. In November 2005, Uzbekistan signed a mutual defense treaty with Russia.

Europe

In April 2004, the European Bank for Reconstruction and Development announced it was cutting aid to Uzbekistan because of the country's record on economic reform and its failure to deal with human rights abuses. The decision came almost a year after Uzbekistan hosted the annual meeting of European Bank for Reconstruction and Development. As noted above, the issue of human rights in Uzbekistan has continued to be unresolved. At the close of 2006, the European Union announced that it would renew its sanctions, which included an arms embargo and a travel ban on Uzbek officials. The decision came in the wake of the 2005 Andijan incident (detailed in "Political Conditions"). However, the European body said that it would enter into talks with the Karimov government, which it claimed was trying to deal with these matters.

But in July 2008, a representative from the human rights advocacy group, Human Rights Watch, was expelled from the country. Earlier, Igor Vorontsov had been denied accreditation on the grounds that he was unfamiliar with the mentality of the Uzbek people and thus was unable to adequately assess the situation on the ground. Accordingly, Human Rights Watch issued a statement charging that Tashkent not only failed to make progress toward meeting the demands by the European Union for human rights reform, but instead it had actually regressed in several areas. At issue was Uzbekistan's call for an end to sanctions by the European Union following the 2005 Andijan massacre. This development flew directly in the face of key demands at stake, such as the release of human rights advocates and the accreditation of human rights representatives.

United States

The United States (U.S.) recognized the independence of Uzbekistan on December 25, 1991, and opened an Embassy in Tashkent in March 1992.

The United States believes its own interests will best be served by the development of an independent, stable, prosperous, and democratic Central Asia. As the most populous country in Central Asia and the geographic and strategic center of Central Asia, Uzbekistan plays a pivotal role in the region. The United States accordingly has developed a broad relationship covering

political, military, nonproliferation, economic, trade, assistance, and related issues. This has been institutionalized through the establishment of the United States -Uzbekistan Joint Commission, which held its first meeting in February 1998.

U.S.-Uzbek relations nevertheless developed slowly and reached a peak following the U.S. decision to invade Afghanistan following the September 11, 2001 terror attacks. Uzbekistan had been a strong partner of the United States on foreign policy, fighting terrorism, and security issues ranging from Iraq to Cuba, nuclear proliferation to narcotics trafficking.

Relations cooled significantly following the "revolutions" in Georgia, Ukraine, and Kyrgyzstan in 2003-2005, and the government of Uzbekistan sought to limit the influence of U.S. and other foreign non-governmental organizations (NGOs) working on civil society, political reform, and human rights inside the country.

As noted above and in the "Political Conditions" of this review, the strategic relationship between the United States and Uzbekistan may have contributed to the attack in 2004 on the United States embassy in Tashkent.

In 2005, the United States was notably silent in response to government's reaction to the deaths of people during a violent riot in Andijan, although it did call for an investigation into the matter. Relations then deteriorated rapidly following U.S. and European demands for an independent, international investigation into the May 2005 Andijon violence. Since then, the U.S. has urged greater reform as necessary for long-term stability and prosperity. Enforcement of constitutional safeguards ensuring personal, religious, and press freedom and civil liberties, are some of the changes the United States would like to see in Uzbekistan.

Relations have improved since the second half of 2007 as both the United States and Uzbekistan sought re-engagement under the terms of the March 2002 Declaration of Strategic Partnership between the two countries. The declaration covers not only security and economic relations but political reform, economic reform, and human rights. Uzbekistan has Central Asia's largest population and is vital to U.S., regional, and international efforts to promote stability and security.

The first part of the year 2009 was marked by President Karimov's move to allow the United States to transport military supplies through Uzbek territory to troops in Afghanistan, where the fight against Islamic militants -- known as the Taliban -- was ongoing.

Foreign Relations/Global Security Note

FBI arrests two Uzbeks and one Kazakh national of seeking to join Islamic State and plotting to kill President Obama

In the last week of February 2015, the Federal Bureau of Investigation (FBI) in United States arrested and charged three foreign nationals with conspiracy to provide material support to a foreign terrorist organization. According to the criminal complaint, the three men sought to join the notorious terror group, Islamic State. The criminal complaint also alleged that the three men had determined that if they were unable to travel to Syria to join Islamic State, they would shift their focus and carry out attacks in the United States, including the attempted assassination of President Barack Obama.

The men -- Abdurasul Juraboev and Abror Habibov of Uzbekistan, and Akhror Saidakhmetov of Kazakhstan, came to the attention of federal authorities due to their postings on a Uzbek language website. Federal agents said that Juraboev purchased an airplane ticket to travel from New York to Istanbul, presumably with the intent of traveling on to Syria where he intended to join Islamic State. But Juraboev was also accused of conspiring to carry out the possible assassination of the United States leader, as illustrated by his posting to an Uzbek-language website, which read as follows: "I am in USA now but we don't have any arms. But is it possible to commit ourselves as dedicated martyrs anyway while here? What I'm saying is, to shoot Obama and then get shot ourselves, will it do? That will strike fear in the hearts of infidels." Meanwhile, Saidakhmetov was likewise accused of intending to join the notorious terror group, while also plotting attacks on the United States homeland. In a conversation with an informant, Saidakhmetov was reported to have said, "We will go and purchase one handgun ... then go and shoot one police officer. Boom ... Then we will go the FBI headquarters, kill the FBI People." Saidakhmetov was arrested at John F Kennedy International Airport in New York as he tried to board a flight bound for Turkey, allegedly en route to Syria where he would join Islamic State. The charges against Habibov involved providing material assistance to Saidakhmetov.

Each of the three defendants, if convicted, faced a maximum sentence of 15 years in prison. In her announcement of the arrests, United States Attorney for the Eastern District of New York, Loretta Lynch, warned that the threat of foreign nationals posing a threat to the United States and its allies was a growing one. Lynch, who was President Obama's nominee to replace outgoing Eric Holder as the United States new attorney general, said, "The flow of foreign fighters to Syria represents an evolving threat to our country and to our allies."

National Security

External Threats

No foreign nation poses an immediate military threat to Uzbekistan. In recent years, its government remained engaged in territorial disputes with Kyrgyzstan and Tajikistan over sections of Uzbekistan's boundary with those countries.

Crime

Uzbekistan is a regional narcotics trafficking hub. It serves as an interim destination for Afghan narcotics bound for Russia and, to a lesser extent, Western Europe. Likewise, precursor chemicals used in the production of heroin transit Uzbekistan en route to Afghanistan. Cannabis and poppy are cultivated there on a limited basis, mostly for domestic consumption. Outside of drug trafficking and related activity, Uzbekistan has a generally low crime rate, though the United States (U.S.) Department of State does report the occurrence of street crime there.

Insurgencies

Islamic militant organizations operating throughout Central Asia pose an ongoing threat to the government and general population of Uzbekistan. In addition to al-Qaida, two of its affiliate organizations have a significant presence in the region: the Islamic Movement of Uzbekistan (IMU) and the Eastern Turkistan Islamic Movement (ETIM). IMU specifically seeks the overthrow of the Uzbek government and its replacement with an Islamic regime. Towards that end, it has perpetrated attacks inside Uzbekistan. Though ETIM has not, the organization has demonstrated a willingness to commit acts of violence outside of its principle base of operations, China, in pursuit of its principle objective: to establish an independent "Eastern Turkistan," an area that would include Turkey, Kazakhstan, Kyrgyzstan, Uzbekistan, Pakistan, Afghanistan, and the Chinese province of Xinjiang. A fourth organization, Hizb ut-Tahrir al Islami (HT), has also attracted the attention of the United States government as a possible catalyst of terrorist violence in the region. HT generally advocates the overthrow of secular governments in Central Asia and their replacement with fundamentalist, Islamic governments (see section below on terrorism).

Terrorism

Regionally based Islamic militant organizations pose an ongoing threat to Uzbekistan's security. In addition to al-Qaida, two of its affiliate organizations have a significant presence in Central Asia: the Islamic Movement of Uzbekistan (IMU) and the Eastern Turkistan Islamic Movement (ETIM). IMU has perpetrated attacks inside Uzbekistan. Though ETIM reportedly has not, the organization has demonstrated a willingness to commit acts of violence outside of its principle base of

operations, China, in pursuit of its Islamic fundamentalist objective. A fourth organization, Hizb ut-Tahrir al Islami (HT), has also attracted the attention of the United States government as a possible catalyst of terrorist violence in the region.

IMU seeks the overthrow of the Uzbek government and its replacement with an Islamic regime. Like al-Qaida, IMU is also virulently anti-Western. Prior to 2001, IMU focused chiefly on targets inside Uzbekistan. It is allegedly responsible for five car bombings that occurred in Tashkent in February 1999. In addition to attacks in Uzbekistan, IMU has been linked to a number of terrorist incidents in Kyrgyzstan, including the 1999 abduction of four U.S. climbers and the 2000 abduction of four Japanese geologists and eight Kyrgyz soldiers. The Kyrgyz government also blames IMU for the December 2002 bombing of a bazaar frequented by foreigners and the May 2003 bombing of a bank in Osh. Officials in Kyrgyzstan interrupted a plot to bomb the United States embassy and a nearby hotel there in 2003. In February 2003, Kyrgyz courts sentenced Sherali Akbotoyev, a Kyrgyz member of IMU, to 25 years in prison. Likewise, Uzbek courts convicted IMU member Azizbek Karimov for his reported participation in the planning of the thwarted attack against the U.S. embassy in Kyrgyzstan. IMU is believed to have fewer than 700 total members.

Similarly oriented, the Eastern Turkistan Islamic Movement (ETIM) is based in China's western Xinjiang Province. It is comprised of ethnic Uighur separatists who seek to establish an independent "Eastern Turkistan," an area that would include Turkey, Kazakhstan, Kyrgyzstan, Uzbekistan, Pakistan, Afghanistan, and Xinjiang. Likewise, ETIM has demonstrated an anti-Western bent. The U.S. Department of State reports that from 1990 to 2001, ETIM orchestrated over 200 acts of terrorism in China, which resulted in at least 162 deaths and over 440 injuries. In May 2002, Kyrgyz officials deported two ETIM members to China for allegedly plotting to attack the United States embassy in Kyrgyzstan, and other U.S. interests abroad. The U.S. Department of State indicates that ETIM's agenda to create a pan-Asian, Turkic state does not enjoy widespread support among China's ethnic Uighurs. The group's total membership is unknown, but it is believed to have few operatives. There is no evidence to suggest that ETIM has conducted or planned any attacks inside of Uzbekistan. However, the organization's affiliation with the al-Qaida network and its demonstrated willingness to perpetrate attacks outside of its base of operations precipitate an ongoing threat to Uzbekistan's security.

The United States government has identified a fourth organization, Hizb ut-Tahrir al Islami (HT), as a potential threat to the Central Asian region. Unlike al-Qaida, IMU, or ETIM, however, HT is not believed to be responsible for any acts of violence. Founded in the Middle East in the 1950s, HT is a secretive organization that generally advocates a strict interpretation of the sharia, Islamic law. It has evolved into a transnational organization, drawing support from Muslims throughout Asia, Europe and the Middle East. In Central Asia, HT has traditionally been comprised of ethnic Uzbeks. More recently, it has begun recruiting new members in Kyrgyzstan, Tajikistan, and, to a lesser extent in Kazakhstan. Like other Islamic Fundamentalist organizations active in the region,

HT preaches the overthrow of Central Asia's secular governments and their replacement with Islamic regimes. Since the commencement of Operation Enduring Freedom in Afghanistan, HT has adopted a decidedly militant tone. The organization's leaflets have praised suicide attacks in Israel, denounced the presence of coalition forces in Central Asia, claimed that the United States and the United Kingdom are at war with Islam, and called upon Muslims to defend their faith by engaging in jihad with those countries. Thus, HT's rhetoric, rather than its actions, makes it a potential threat to the security of Central Asian countries. Though it has not committed any acts of terrorism, it clearly promotes violence in the name of an orthodox interpretation of Islam.

Uzbekistan's highly authoritarian government has adopted a particularly hard line towards Islamic fundamentalism. It has banned HT all together. According to recent reports, it had reportedly incarcerated between 5,300 and 5,800 alleged Islamic extremists. Its tactics have been so harsh, in fact, that the Uzbek government has attracted the attention of human rights watch groups. Uzbek law enforcement and intelligence officials allegedly engage in the torture of suspects. Conditions in Uzbek prisons are extremely poor. In the past several years, a number of detainees have reportedly died from disease and abuse. The identity of the group responsible for bombings that occurred between March 28 and April 1, 2004, in Tashkent and Bukhara remained unknown. Uzbekistan is party to all twelve international protocols and conventions pertaining to terrorism.

Foreign Relations/Global Security Note

FBI arrests two Uzbeks and one Kazakh national of seeking to join Islamic State and plotting to kill President Obama

In the last week of February 2015, the Federal Bureau of Investigation (FBI) in United States arrested and charged three foreign nationals with conspiracy to provide material support to a foreign terrorist organization. According to the criminal complaint, the three men sought to join the notorious terror group, Islamic State. The criminal complaint also alleged that the three men had determined that if they were unable to travel to Syria to join Islamic State, they would shift their focus and carry out attacks in the United States, including the attempted assassination of President Barack Obama.

The men -- Abdurasul Juraboev and Abror Habibov of Uzbekistan, and Akhror Saidakhmetov of Kazakhstan, came to the attention of federal authorities due to their postings on a Uzbek language website. Federal agents said that Juraboev purchased an airplane ticket to travel from New York to Istanbul, presumably with the intent of traveling on to Syria where he intended to join Islamic State. But Juraboev was also accused of conspiring to carry out the possible assassination of the United States leader, as illustrated by his posting to an Uzbek-language website, which read as follows: "I am in USA now but we don't have any arms. But is it possible to commit ourselves as dedicated martyrs anyway while here? What I'm saying is, to shoot Obama and then get shot

ourselves, will it do? That will strike fear in the hearts of infidels." Meanwhile, Saidakhmetov was likewise accused of intending to join the notorious terror group, while also plotting attacks on the United States homeland. In a conversation with an informant, Saidakhmetov was reported to have said, "We will go and purchase one handgun ... then go and shoot one police officer. Boom ... Then we will go the FBI headquarters, kill the FBI People." Saidakhmetov was arrested at John F Kennedy International Airport in New York as he tried to board a flight bound for Turkey, allegedly en route to Syria where he would join Islamic State. The charges against Habibov involved providing material assistance to Saidakhmeto.

Each of the three defendants, if convicted, faced a maximum sentence of 15 years in prison. In her announcement of the arrests, United States Attorney for the Eastern District of New York, Loretta Lynch, warned that the threat of foreign nationals posing a threat to the United States and its allies was a growing one. Lynch, who was President Obama's nominee to replace outgoing Eric Holder as the United States new attorney general, said, "The flow of foreign fighters to Syria represents an evolving threat to our country and to our allies."

Chapter 3

Economic Overview

Economic Overview

Overview

Uzbekistan is the most populous country in Central Asia. The nation has a strong agricultural base and is one of the world's largest producers of cotton. Uzbekistan is now the world's second-largest cotton exporter and fifth largest producer. Although it has come under increasing international criticism for the use of child labor in its annual cotton harvest, Uzbekistan enjoyed a bumper cotton crop in 2010 amidst record high prices. The country is also endowed with abundant natural resources, including hydrocarbons, gold, copper, and uranium. The breakup of the economic links with the Soviet Union following independence in 1991 led to a sharp decline of economic growth.

In recent years, Uzbekistan has enjoyed strong economic performance on the back of a favorable external environment and improvements in macroeconomic policies. Although the economy was affected by the global economic crisis through weaker external demand and lower remittances, economic growth in Uzbekistan remained strong in 2009 and 2010 largely due to the government's timely and effective response to the crisis that helped limit the impact of the global crisis and its relative isolation from the global financial markets. Supported by healthy budget revenues and good export performance of gold and natural gas, the government implemented the anti-crisis program through fiscal stimulus measures, including recapitalization of the commercial banks, an increase in spending on infrastructure, reduction in the tax burden, and increases in public sector wages. Uzbekistan enjoyed a bumper cotton crop in 2010 in the face of record high prices, but is gradually diversifying away from cotton toward more high-value fruits and vegetables. With continued effects of the anti-crisis program, in particular the government's industrial modernization and infrastructure development program, together with the better external environment, economic growth was expected to remain strong for Uzbekistan in the near term. In the past Uzbekistani authorities have accused U.S. and other foreign companies operating in Uzbekistan of violating the country's tax laws and have frozen their assets, with several new expropriations in 2010 and 2011. At the same time, the Uzbekistani government has actively courted several major U.S. and international corporations, offering attractive financing and tax advantages. This has paid off and the country snagged a significant U.S. investment in the automotive industry, including the opening of a powertrain manufacturing facility in Tashkent in November 2011. Then in June 2012, PetroVietnam Exploration & Production announced plans to invest \$61.6 million in a geological survey for oil and gas in Uzbekistan's Ustyurt region. Trade between Uzbekistan and Russia amounted to about \$6.7 billion dollars, up 9 percent compared to the previous year. Overall, Uzbekistan's economic growth was robust in 2011 and that strength continued through the first quarter of 2012, driven by services, transport and communication, and trade. High inflation

remained an issue though.

Overall, Uzbekistan saw strong GDP growth in 2012, supported by commodity export revenues, foreign remittances and the government's large investments program. By year's end, the country's sovereign balance sheet remained strong. In July 2013, Fitch Ratings noted that Uzbekistan banks had demonstrated stable growth rates (albeit from a quite low base), relying mostly on domestic savings. Still, the economy was vulnerable to external commodity shocks as well as to potential deterioration in its major trading partners (Russia, China and Kazakhstan). On top of that, institutional reforms remained dormant, and there had been no marked progress in improving the difficult business climate.

Despite the deterioration in the global environment, the economy of Uzbekistan continued to grow rapidly in 2013. Strong fiscal and external positions, a stable banking system, and low public debt continued contributing to robust macroeconomic performance in the second part of the year. Real GDP growth was maintained at 8 percent in the first half of 2013, supported by the state-led modernization investment program. Exports of goods and services rose by 12 percent. Despite rapid import growth spurred by capital goods, the current account surplus increased marginally and international reserves remained high.

In July 2014, Fitch Ratings said that the outlook for Uzbekistan's banking sector remained stable, supported by consistently strong economic growth. Overall in 2014, Uzbekistan's economy continued to depend heavily on exports of gold, cotton, natural gas and copper. GDP growth was strong for the year. However, inflation was in double-digits and growth was expected to decline slightly in 2015, reflecting the impact of Russia's economic downturn, which resulted in lower remittances from Uzbek workers in Moscow and hit trade, according to the European Bank for Reconstruction and Development.

In July 2015, the World Bank approved a \$200 million loan to Uzbekistan that would go toward a project involving the reconstruction of local roads. Then in August 2015, it was reported that Uzbekistan had launched projects worth \$700 million for three solar power plants that would pioneer use of the technology in Central Asia.

Economic Performance

Real GDP growth accelerated in 2007 on the back of strong performance in trade, transport and communications, industry, and services. Increased private investment and consumption also contributed to strong growth. Despite the unwinding of the global financial and economic crisis, real GDP growth remained strong in 2008, slowing only moderately in 2009 and 2010, supported by the government's powerful fiscal stimulus program to sustain economic activity during the global recession. GDP growth was strong in 2011 and 2012.

According to CountryWatch estimated calculations for 2014:

Real GDP growth rate was: 7.0 percent

The fiscal deficit/surplus as percent of GDP (%) was: 8.1 percent

Inflation was measured at: 20.3 percent

Updated in 2015

**Please note that the figures in our Economic Performance section are estimates or forecasts based on IMF-based data that are formulated using CountryWatch models of analysis*

Nominal GDP and Components

Nominal GDP and Components					
	2011	2012	2013	2014	2015
Nominal GDP (LCU billions)	77,750.60	96,723.40	118,986.90	144,867.90	175,876.67
Nominal GDP Growth Rate (%)	24.624	24.402	23.018	21.751	21.405
Consumption (LCU billions)	40,719.45	58,530.97	68,941.79	83,062.09	92,772.59
Government Expenditure (LCU billions)	17,649.39	15,282.30	18,799.93	22,744.26	25,403.21
Gross Capital Formation (LCU billions)	17,953.40	27,953.06	32,126.46	39,114.33	54,229.81
Exports of Goods & Services (LCU	25,720.95	26,768.77	35,269.66	42,497.26	56,324.57

	2011	2012	2013	2014	2015
billions)					
Imports of Goods & Services (LCU billions)	24,292.58	31,811.70	36,150.94	42,550.04	52,853.52

Population and GDP Per Capita

Population and GDP Per Capita					
	2011	2012	2013	2014	2015
Population, total (million)	29.100	29.746	30.241	30.604	30.971
Population growth (%)	2.105	2.220	1.664	1.200	1.199
Nominal GDP per Capita (LCU 1000s)	2,671,842.03	3,251,643.92	3,934,621.87	4,733,626.32	5,678,753.2

Real GDP and Inflation

Real GDP and Inflation					
	2011	2012	2013	2014	2015
Real Gross Domestic Product (LCU billions 2005 base)	996.288	1,079.58	1,158.52	1,260.39	1,346.10
Real GDP Growth Rate (%)	7.109	8.361	7.311	8.794	6.800
GDP Deflator (2005=100.0)	7,804.03	8,959.32	10,270.62	11,493.86	13,065.64
Inflation, GDP Deflator (%)	16.352	14.804	14.636	11.910	13.675

Government Spending and Taxation

Government Spending and Taxation					
	2011	2012	2013	2014	2015
Government Fiscal Budget (billions)	25,246.75	32,607.15	40,583.75	48,313.94	61,882.35
Fiscal Budget Growth Rate (percentage)	22.216	29.154	24.463	19.047	28.084
National Tax Rate Net of Transfers (%)	40.249	41.472	36.505	35.535	35.266
Government Revenues Net of Transfers (LCU billions)	31,294.16	40,112.90	43,436.67	51,478.88	62,024.74
Government Surplus(-) Deficit(+) (LCU billions)	6,047.41	7,505.74	2,852.92	3,164.94	142.392
Government Surplus(+) Deficit(-) (%GDP)	7.778	7.760	2.398	2.185	0.0810

Money Supply, Interest Rates and Unemployment

Money Supply, Interest Rates and Unemployment					
	2011	2012	2013	2014	2015
Money and Quasi-Money (M2) (LCU billions)	48,880.61	61,193.36	77,395.36	97,503.20	118,373.62
Money Supply Growth Rate (%)	23.758	25.189	26.477	25.981	21.405
Lending Interest Rate (%)	12.670	12.467	12.445	12.087	17.531
Unemployment Rate (%)	0.4539	0.4862	0.4845	0.4820	0.4399

Foreign Trade and the Exchange Rate

Foreign Trade and the Exchange Rate					
	2011	2012	2013	2014	2015
Official Exchange Rate (LCU/\$US)	1,711.78	1,889.68	2,081.28	2,313.70	2,666.70
Trade Balance NIPA (\$US billions)	0.8344	-2.6687	-0.4234	-0.0228	1.302
Trade Balance % of GDP	1.837	-5.2138	-0.7407	-0.0364	1.974
Total Foreign Exchange Reserves (\$US billions)	7.324	8.271	9.178	10.123	9.742

Data in US Dollars

Data in US Dollars					
	2011	2012	2013	2014	2015
Nominal GDP (\$US billions)	45.421	51.185	57.170	62.613	65.953
Exports (\$US billions)	15.026	14.166	16.946	18.368	21.121
Imports (\$US billions)	14.191	16.834	17.370	18.390	19.820

Energy Consumption and Production Standard Units

Energy Consumption and Production Standard Units					
	2011	2012	2013	2014	2015
Petroleum Consumption (TBDP)	75.791	68.012	69.000	64.620	67.303

Economic Performance Index

Economic Performance Index

The Economic Performance rankings are calculated by CountryWatch's editorial team, and are based on criteria including sustained economic growth, monetary stability, current account deficits, budget surplus, unemployment and structural imbalances. Scores are assessed from 0 to 100 using this aforementioned criteria as well as CountryWatch's proprietary economic research data and models.

	Bank stability risk	Monetary/ Currency stability	Government Finances	Empl./ Unempl.	Econ.GNP growth or decline/ forecast

Chapter 4

Investment Overview

Foreign Investment Climate

Background

Uzbekistan is a dry, landlocked country of which 11% consists of intensely cultivated, irrigated river valleys. More than 60% of its population lives in densely populated rural communities.

Uzbekistan is now the world's second-largest cotton exporter and fifth largest producer; it relies heavily on cotton production as the major source of export earnings and has come under increasing international criticism for the use of child labor in its annual cotton harvest. Other major export earners include gold, natural gas, and oil.

In 2006, Uzbekistan took steps to rejoin the Collective Security Treaty Organization (CSTO) and the Eurasian Economic Community (EurASEC), which it subsequently left in 2008, both organizations dominated by Russia. Uzbek authorities have accused United States and other foreign companies operating in Uzbekistan of violating Uzbek tax laws and have frozen their assets.

Foreign Investment Assessment

According to the United States Department of State Commercial Guide for Uzbekistan: "It is the declared policy of the Government of Uzbekistan to attract foreign investment. Direct foreign investors are granted a host of incentives on a case-by-case basis, including tax holidays, duty-free capital goods imports, and protection against expropriation. However, legislative requirements for these benefits are ambiguous, processes and procedures are cumbersome, and the regulatory environment is capricious. While these conditions provide opportunities to companies in a position to turn special decrees and privileges to their advantage, most potential investors are deterred. As a result, Uzbekistan has so far attracted less foreign direct investment per capita than any other CIS country despite its strategic location and considerable economic potential."

Source: United States Department of State Commercial Guide for Uzbekistan.

Note: Information about Uzbekistan's trade regime can be found via Business Information Service

for Newly Independent States.

Labor Force

Labor force: 14.2 million

Labor force - by occupation: agriculture 44%, industry 20%, services 36%

Agriculture and Industry

Agriculture - products: cotton, vegetables, fruits, grain; livestock

Industries: textiles, food processing, machine building, metallurgy, natural gas, chemicals

Import Commodities and Import Partners

Imports - commodities: machinery and equipment 49.8%, foodstuffs 16.4%, chemicals, metals

Imports - partners: Russia 22.3%, US 11.4%, South Korea 11%, Germany 9.5%, China 6.5%, Kazakhstan 6.1%, Turkey 6.1%

Export Commodities and Export Partners

Exports - commodities: cotton 41.5%, gold 9.6%, energy products 9.6%, mineral fertilizers, ferrous metals, textiles, food products, automobiles

Exports - partners: Russia 22.4%, China 9.3%, Ukraine 7.5%, Tajikistan 6.2%, Bangladesh 4.7%, Turkey 4.6%, Japan 4.3%, Kazakhstan 4.2%, US 4.1%

Telephone System

Telephones - main lines in use: 1,717,100

Telephones - mobile cellular: 320,800

general assessment: antiquated and inadequate; in serious need of modernization

domestic: the domestic telephone system is being expanded and technologically improved, particularly in Tashkent (Toshkent) and Samarqand, under contracts with prominent companies in industrialized countries; moreover, by 1998, six cellular networks had been placed in operation - four of the GSM type (Global System for Mobile Communication), one D-AMPS type (Digital

Advanced Mobile Phone System), and one AMPS type (Advanced Mobile Phone System)

international: country code - 998

Note -- linked by landline or microwave radio relay with CIS member states and to other countries by leased connection via the Moscow international gateway switch; after the completion of the Uzbek link to the Trans-Asia-Europe (TAE) fiber-optic cable, Uzbekistan will be independent of Russian facilities for international communications; Inmarsat also provides an international connection, albeit an expensive one

Internet Users

Internet hosts: 1,040

Internet users: 492,000

Roads, Airports, Ports and Harbors

Railways: total: 3,950 km

Highways: total: 81,600 km

Ports and harbors: Termiz (Amu Darya)

Airports: 247; with paved runways: total: 33

Legal System and Considerations

The legal system is an evolution of Soviet civil law and the country still lacks an independent judicial system. As regards dispute settlement, businesses have complained that they lack access under Uzbek law to international arbitration. Moreover, the judiciary in Uzbekistan is not independent and courts frequently favor firms that are controlled or owned by the state.

Corruption Perception Ranking

See corruption index, as reported by Transparency International, in this Country Review. Typically, Uzbekistan ranks as one of the most corrupt countries, according to this index.

Cultural Considerations

Uzbekistan is a predominantly Muslim culture and although it is not considered to be a fundamentalist Islamic country, respect for religious conventions should be given.

Foreign Investment Index

Foreign Investment Index

The Foreign Investment Index is a proprietary index measuring attractiveness to international investment flows. The Foreign Investment Index is calculated using an established methodology by CountryWatch's Editor-in-Chief and is based on a given country's economic stability (sustained economic growth, monetary stability, current account deficits, budget surplus), economic risk (risk of non-servicing of payments for goods or services, loans and trade-related finance, risk of sovereign default), business and investment climate (property rights, labor force and laws, regulatory transparency, openness to foreign investment, market conditions, and stability of government). Scores are assigned from 0-10 using the aforementioned criteria. A score of 0 marks the lowest level of foreign investment viability, while a score of 10 marks the highest level of foreign investment viability, according to this proprietary index.

Yemen	3
Zambia	4.5-5
Zimbabwe	3.5

Editor's Note:

As of 2015, the global economic crisis (emerging in 2008) had affected many countries across the world, resulting in changes to their rankings. Among those countries affected were top tier economies, such as the [United Kingdom](#), [Iceland](#), [Switzerland](#) and [Austria](#). However, in all these cases, their rankings have moved back upward in the last couple of years as anxieties have eased. Other top tier countries, such as [Spain](#), [Portugal](#), [Ireland](#), and [Italy](#), suffered some effects due to debt woes and the concomitant effect on the euro zone. Greece, another euro zone nation, was also downgraded due to its sovereign debt crisis; however, Greece's position on the precipice of default incurred a sharper downgrade than the other four euro zone countries mentioned above. Cyprus' exposure to Greek bank yielded a downgrade in its case. Slovenia and [Latvia](#) have been slightly downgraded due to a mix of economic and political concerns but could easily be upgraded in a future assessment, should these concerns abate. Meanwhile, the crisis in eastern [Ukraine](#) fueled downgrades in that country and neighboring [Russia](#).

Despite the "trifecta of tragedy" in [Japan](#) in 2011 -- the earthquake, the ensuing tsunami, and the resulting nuclear crisis -- and the appreciable destabilization of the economic and political terrain therein, this country has only slightly been downgraded. Japan's challenges have been assessed to be transient, the government remains accountable, and there is little risk of default. Both [India](#) and China retain their rankings; [India](#) holds a slightly higher ranking than [China](#) due to its record of democratic representation and accountability.

There were shifts in opposite directions for [Mali](#) and [Nigeria](#) versus the [Central African Republic](#), [Burkina Faso](#), and [Burundi](#). [Mali](#) was slightly upgraded due to its efforts to return to constitutional order following the 2012 coup and to neutralize the threat of separatists and Islamists. Likewise, a new government in [Nigeria](#) generated a slight upgrade as the country attempts to confront corruption, crime, and terrorism. But the [Central African Republic](#) was downgraded due to the takeover of the government by Seleka rebels and the continued decline into lawlessness in that country. Likewise, the attempts by the leaders of [Burundi](#) and [Burkina Faso](#) to hold onto power by by-passing the constitution raised eyebrows and resulted in downgrades.

Political unrest in [Libya](#) and [Algeria](#) have contributed to a decision to marginally downgrade these countries as well. [Syria](#) incurred a sharper downgrade due to the devolution into de facto civil war and the dire security threat posed by Islamist terrorists. [Iraq](#) saw a similar downgrade as a result of the takeover of wide swaths of territory and the threat of genocide at the hands of Islamist terrorists. [Yemen](#), likewise, has been downgraded due to political instability at the hands of secessionists, terrorists, Houthi rebels, and the intervention of external parties. Conversely, [Egypt](#) and [Tunisia](#) saw slight upgrades as their political environments stabilize.

At the low end of the spectrum, devolving security conditions and/or economic crisis have resulted in countries like [Pakistan](#), [Afghanistan](#), [Somalia](#), and [Zimbabwe](#) maintaining their low ratings.

The [United States](#) continues to retain its previous slight downgrade due to the enduring threat of default surrounding the debt ceiling in that country, matched by a conflict-ridden political climate. In the case of [Mexico](#), there is limited concern about default, but increasing alarm over the security situation in that country and the government's ability to contain it. In [Argentina](#), a default to bond holders resulted in a downgrade to that country. Finally, a small but significant upgrade was attributed to [Cuba](#) due to its recent pro-business reforms and its normalization of ties with the United States.

Corruption Perceptions Index

Corruption Perceptions Index

Transparency International: [Corruption Perceptions Index](#)

Editor's Note:

Transparency International's [Corruption Perceptions Index](#) is a composite index which ranks countries in terms of the degree to which corruption is perceived to exist among public officials. This index indicates the views of national and international business people and analysts about the levels of corruption in each country. The highest (and best) level of transparency is indicated by the number, 10. The lower (and worse) levels of transparency are indicated by lower numbers.

Rank	Country/Territory	CPI 2009 Score	Surveys Used	Confidence Range

179	Afghanistan	1.3	4	1.0 - 1.5
180	Somalia	1.1	3	0.9 - 1.4

Methodology:

As noted above, the highest (and best) level of transparency with the least perceived corruption is indicated by the number, 10. The lower (and worse) levels of transparency are indicated by lower numbers.

According to Transparency International, the [Corruption Perceptions Index](#) (CPI) table shows a country's ranking and score, the number of surveys used to determine the score, and the confidence range of the scoring.

The rank shows how one country compares to others included in the index. The CPI score indicates the perceived level of public-sector corruption in a country/territory.

The CPI is based on 13 independent surveys. However, not all surveys include all countries. The surveys used column indicates how many surveys were relied upon to determine the score for that country.

The confidence range indicates the reliability of the CPI scores and tells us that allowing for a margin of error, we can be 90% confident that the true score for this country lies within this range.

Note:

Kosovo, which separated from the Yugoslav successor state of [Serbia](#), is not listed above. No calculation is available for [Kosovo](#) at this time, however, a future corruption index by Transparency International may include the world's newest country in its tally. Taiwan has been listed above despite its contested status; while Taiwan claims sovereign status, [China](#) claims ultimate jurisdiction over Taiwan. Hong Kong, which is also under the rubric of Chinese sovereignty, is listed above. Note as well that Puerto Rico, which is a [United States](#) domain, is also included in the list above. These inclusions likely have to do with the size and fairly autonomous status of their economies.

Competitiveness Ranking

Competitiveness Ranking

Editor's Note:

The Global Competitiveness Report's competitiveness ranking is based on the Global Competitiveness Index (GCI), which was developed for the World Economic Forum. The GCI is based on a number of competitiveness considerations, and provides a comprehensive picture of the competitiveness landscape in countries around the world. The competitiveness considerations are: institutions, infrastructure, macroeconomic environment, health and primary education, higher education and training, goods market efficiency, labour market efficiency, financial market development, technological readiness, market size, business sophistication, and innovation. The rankings are calculated from both publicly available data and the Executive Opinion Survey.

Country/Economy	GCI 2010 Rank	GCI 2010 Score	GCI 2009 Rank	Change 2009-2010
Switzerland	1	5.63	1	0

Methodology:

The competitiveness rankings are calculated from both publicly available data and the Executive Opinion Survey, a comprehensive annual survey conducted by the World Economic Forum together with its network of Partner Institutes (leading research institutes and business organizations) in the countries covered by the Report.

Highlights according to WEF --

- The [United States](#) falls two places to fourth position, overtaken by [Sweden](#) and [Singapore](#) in the rankings of the World Economic Forum's Global Competitiveness Report 2010-2011
- The People's Republic of [China](#) continues to move up the rankings, with marked improvements in several other Asian countries
- [Germany](#) moves up two places to fifth place, leading the Eurozone countries
- [Switzerland](#) tops the rankings

Updated:

2011 using most recent ranking available; reviewed in 2015.

Taxation

Corporate tax

The main corporate tax rate is 12 percent

Individual tax

Individual tax rates are progressive and range from 13 percent to as high as 29 percent.

Capital gains

Capital gains are taxed as income.

Indirect tax

The value-added tax (VAT) is applied at a standard rate of 20 percent. There are exemptions in the following arenas: financial services, public utilities, transport and public education. As well, the following arenas are zero rated: exports and certain agricultural products.

Stock Market

At the end of the 1990s, the Tashkent Republican Stock Exchange was operational.

Chapter 5

Social Overview

People

Demography

Uzbekistan is Central Asia's most highly populated country. The Uzbek population - - approximately 28 million in total -- is concentrated in the south and east of the country. Uzbekistan had been one of the poorest republics of the Soviet Union; much of its population was engaged in cotton farming in small rural communities. The people continue to be heavily rural and dependent on farming for their livelihoods.

Culture and Ethnography

Today, ethnic Uzbeks comprise approximately 80 percent of Uzbekistan's total population. There are also ethnic Russians, Tajiks, Kazakhs, Karakalpaks, Tatars and others. The government of Uzbekistan has stated that there are over 129 ethnic minorities living in this country.

Uzbek is regarded as the first language of Uzbekistan, although both Russian and Tajik are frequently used minority languages. Russian is especially popular in inter-ethnic community use, as well as in governmental and business affairs. Uzbek, a derivative of the Turkic linguistic family, includes a variety of dialects and a mixed vocabulary of Arabic, Persian and Russian loanwords. In the 1920s, the Soviet government replaced the original Arabic alphabet with an alphabet based on Latin script. That alphabet was subsequently replaced with an alphabet based on Cyrillic script.

In terms of religious affiliation, Sunni Islam is predominant, accounting for approximately 88 percent of Uzbeks. About 9 percent of the populace is Eastern Orthodox. The remainder of the population belong to other religions. Despite the numerical predominance of Muslims in Uzbekistan, this is not a country that has been highly Islamicized. In fact, the government has been so adamant about suppressing religious expression that it has been criticized by human rights groups.

Human Development

About 5.2 percent of GDP is spent on health expenditures. Access to sanitation, water, and health

care is considered to be generally good. In terms of health and welfare, Uzbeks are expected to have an average life expectancy of 64 years of age -- 60 years for males and 68 years for females, according to recent estimates. The United Nations Development Programme determined that the infant mortality rate is 45 deaths per 1,000 live births, however, other estimates suggest that it is higher at 71 deaths per 1,000 live births. Although life expectancy is respectably long, there has been a decline in health care resources in the wake of the collapse of the former Soviet Union, thus reducing health care quality, accessibility, and efficiency.

An estimated 98 to 99 percent of the total population, age 15 and older, can read and write, suggesting that the educational system achieved a high rate of literacy in its population basis. The mean amount of schooling for both men and women is 11 years. However, due to budget constraints and other transition problems following the collapse of the Soviet Union, texts and other school supplies, teaching methods, curricula, and educational institutions are outdated, inappropriate, and poorly kept. Additionally, the proportion of school-aged persons enrolled has been dropping. While the government is concerned about this, budgets remain tight, and foreign aid for education has not been sufficient to compensate.

One notable indicator used to measure a country's quality of life is the Human Development Index (HDI), which is compiled annually since 1990 by the United Nations Development Programme (UNDP). The HDI is a composite of several indicators, which measure a country's achievements in three main arenas of human development: longevity, knowledge and education, as well as economic standard of living. In a recent ranking of 169 countries, the HDI placed Uzbekistan in the medium human development category, at 102nd place.

Note: Although the concept of human development is complicated and cannot be properly captured by values and indices, the HDI, which is calculated and updated annually, offers a wide-ranging assessment of human development in certain countries, not based solely upon traditional economic and financial indicators.

Written by Dr. Denise Youngblood Coleman, Editor in Chief, www.countrywatch.com; see Bibliography for research sources.

Human Development Index

Human Development Index

Human Development Index (Ranked Numerically)

The [Human Development Index](#) (HDI) is used to measure quality of life in countries across the world. The HDI has been compiled since 1990 by the United Nations Development Programme (UNDP) on a regular basis. The HDI is a composite of several indicators, which measure a country's achievements in three main arenas of human development: longevity, education, and economic standard of living. Although the concept of human development is complicated and cannot be properly captured by values and indices, the HDI offers a wide-ranging assessment of human development in certain countries, not based solely upon traditional economic and financial indicators. For more information about the methodology used to calculate the HDI, please see the "Source Materials" in the appendices of this review.

Life Satisfaction Index

Life Satisfaction Index

Life Satisfaction Index

Created by Adrian G. White, an Analytic Social Psychologist at the University of Leicester, the "Satisfaction with Life Index" measures subjective life satisfaction across various countries. The data was taken from a metastudy (see below for source) and associates the notion of subjective happiness or life satisfaction with qualitative parameters such as health, wealth, and access to basic education. This assessment serves as an alternative to other measures of happiness that tend to rely on traditional and quantitative measures of policy on quality of life, such as GNP and GDP. The methodology involved the responses of 80,000 people across the globe.

178	Burundi	100

Commentary:

European countries, such as [Denmark](#), [Iceland](#), [Finland](#), [Sweden](#), [Switzerland](#), [Austria](#) resided at the top of the ranking with highest levels of self-reported life satisfaction. Conversely, European countries such as [Latvia](#), [Lithuania](#), [Moldova](#), [Belarus](#) and [Ukraine](#) ranked low on the index. African countries such as Democratic Republic of Congo, [Zimbabwe](#) and [Burundi](#) found themselves at the very bottom of the ranking, and indeed, very few African countries could be found in the top 100. [Japan](#) was at the mid-way point in the ranking, however, other Asian countries such as [Brunei](#) and [Malaysia](#) were in the top tier, while [Pakistan](#) was close to the bottom with a low level of self-identified life satisfaction. As a region, the Middle East presented a mixed bag with Saudi Arabians reporting healthy levels of life satisfaction and Egyptians near the bottom of the ranking. As a region, Caribbean countries were ranked highly, consistently demonstrating high levels of life satisfaction. The findings showed that health was the most crucial determining factor in life satisfaction, followed by prosperity and education.

Happy Planet Index

Happy Planet Index

The Happy Planet Index (HPI) is used to measure human well-being in conjunction with environmental impact. The HPI has been compiled since 2006 by the New Economics Foundation. The index is a composite of several indicators including subjective life satisfaction, life expectancy at birth, and ecological footprint per capita.

As noted by NEFA, the HPI "reveals the ecological efficiency with which human well-being is delivered." Indeed, the index combines environmental impact with human well-being to measure the environmental efficiency with which, country by country, people live long and happy lives. The countries ranked highest by the HPI are not necessarily the ones with the happiest people overall, but the ones that allow their citizens to live long and fulfilling lives, without negatively impacting this opportunity for either future generations or citizens of other countries. Accordingly, a country like the [United States](#) will rank low on this list due to its large per capital ecological footprint, which uses more than its fair share of resources, and will likely cause planetary damage.

It should be noted that the HPI was designed to be a counterpoint to other well-established indices of countries' development, such as Gross Domestic Product (GDP), which measures overall national wealth and economic development, but often obfuscates the realities of countries with stark variances between the rich and the poor. Moreover, the objective of most of the world's people is not to be wealthy but to be happy. The HPI also differs from the [Human Development Index](#) (HDI), which measures quality of life but not ecology, since it [HPI] also includes sustainability as a key indicator.

Year Women Received the Right to Stand for Election:

1938

*The Gender Development Index (GDI) is a composite index which measures the average achievement in a country. While very similar to the Human Development Index in its use of the same variables, the GDI adjusts the average achievement of each country in terms of life expectancy, enrollment in schools, income, and literacy in accordance to the disparities between males and females.

*The Gender Empowerment Measure (GEM) is a composite index measuring gender inequality in three of the basic dimensions of empowerment; economic participation and decision-making, political participation and decision-making, and power over economic resources.

*Total Fertility Rate (TFR) is defined as the average number of babies born to women during their

reproductive years. A TFR of 2.1 is considered the replacement rate; once a TFR of a population reaches 2.1 the population will remain stable assuming no immigration or emigration takes place. When the TFR is greater than 2.1 a population will increase and when it is less than 2.1 a population will eventually decrease, although due to the age structure of a population it will take years before a low TFR is translated into lower population.

*Maternal Mortality Rate is the number of deaths to women per 100,000 live births that resulted from conditions related to pregnancy and or delivery related complications.

*Economically Active Females are the share of the female population, ages 15 and above, whom supply, or are able to supply, labor for the production of goods and services.

*Female Contributing Family Workers are those females who work without pay in an economic enterprise operated by a relative living in the same household.

*Estimated Earned Income is measured according to Purchasing Power Parity (PPP) in US dollars.

Global Gender Gap Index

Global Gender Gap Index

Editor's Note:

The Global Gender Gap Index by the World Economic Forum ranks most of the world's countries in terms of the division of resources and opportunities among males and females. Specifically, the ranking assesses the gender inequality gap in these four arenas:

1. Economic participation and opportunity (salaries and high skilled employment participation levels)
2. Educational attainment (access to basic and higher level education)
3. Political empowerment (representation in decision-making structures)
4. Health and survival (life expectancy and sex ratio)

*new country 2010

Commentary:

According to the report's index, Nordic countries, such as [Iceland](#), [Norway](#), [Finland](#), and [Sweden](#) have continued to dominate at the top of the ranking for gender equality. Meanwhile, [France](#) has seen a notable decline in the ranking, largely as a result of decreased number of women holding ministerial portfolios in that country. In the Americas, the [United States](#) has risen in the ranking to top the region, predominantly as a result of a decreasing wage gap, as well as higher number of women holding key positions in the current Obama administration. [Canada](#) has continued to remain as one of the top ranking countries of the Americas, followed by the small Caribbean island nation of Trinidad and Tobago, which has the distinction of being among the top three countries of the Americans in the realm of gender equality. [Lesotho](#) and South African ranked highly in the index, leading not only among African countries but also in global context. Despite [Lesotho](#) still lagging in the area of life expectancy, its high ranking was attributed to high levels of female participation in the labor force and female literacy. The [Philippines](#) and [Sri Lanka](#) were the top ranking countries for gender equality for Asia, ranking highly also in global context. The [Philippines](#) has continued to show strong performance in all strong performance on all four dimensions (detailed above) of the index. Finally, in the Arab world, the [United Arab Emirates](#) held the highest-rank within that region of the world; however, its placement near the bottom of the global list highlights the fact that Arab countries are generally poor performers when it comes to the matter of gender equality in global scope.

Culture and Arts

Content coming soon.

Etiquette

Cultural Dos and Taboos

- It is customary to address a person by their first name adding "uzbark" which means brother or sister. Titles are preferable to first names, especially in the case of elders or superiors. The word haji can be used for a Muslim who has been on pilgrimage to Mecca.
- The traditional Muslim greeting is A-salaam a-laykum ("Peace be upon you"), to which the reply is w-laykum o a-salaam ("And upon you be peace").
- One should always expect a lengthy and elaborate greeting. A handshake with inquiries after family, work, home and health is the appropriate form of greeting among men. With women, men should wait to see if the women extend their hands voluntarily. For people who are sitting further away, a gesture of greeting is made by putting the right hand on the heart, making a slight bow with the head. Making complimentary comments about women present is not acceptable.
- Normally, one should be prepared to remove one's shoes before entering a building or a home. When one removes one's shoes, the soles of the shoes are placed together, preventing the sole from being pointed at anyone. Also, among Muslims, one should never show the bottom of one's feet as it is considered offensive. Be sure not to walk on prayer mats, which will likely be present within homes.
- Uzbeks are noted for their kind hospitality to visitors. If one is invited into the home of an Uzbek,

it is customary to take a gift to the host or hostess. Baked goods, chocolates, or a bag of sweets, are good choices. Other suggestions include pens, books, or forms of music. More elaborate offerings, such as a beautiful ornament, possibly from one's own country, would constitute an acceptable gift between business associates.

- When seated for a meal, guests will sit on a low supa (it looks like a bed), covered with flat mattresses called korpas. One should sit where the host suggests; note that the further away one may be seated from the entrance to the room or garden, the more honored one is considered to be. Legs may be stretched under the table and cushions should be used to support you.
- Expect men and women to be seated separately in more traditional (often rural) homes. Both men and women may sit together in more modern homes (usually in cities).
- Meals will begin with tea and candy, followed by hot dishes, vegetables, fruit and drink. The cuisine is greatly influenced by Asian palates, dating back to the ancient days of the Silk Route. Expect to eat heartily and for the meal to go on for several hours, sometimes in to the wee hours of the morning. Note also that the tea ceremony which precedes the meal is very elaborate. Drinking tea is neither a matter of quenching thirst nor of empty symbolism. Drinking tea is a culturally ordained custom denoting hospitality, respect and even friendship.
- Although Uzbekistan is a predominantly Muslim country, it is possible that alcohol (perhaps wine or vodka) may be served as well. Toasting friendship, mutuality, and health, is very important symbolically, and involves clinking glasses or the Uzbek teacup (called the piola) with other guests.
- In conversation, good topic choices include Uzbek history, current or modern achievements, sports and culture. Uzbeks are known as a good-humored people, so interjecting humor is another way to break down the barriers and forge a friendship within this culture. Generally, discussions about politics or religion, while not prohibited, are not recommended among new friends. Also, before embarking upon any kind of business discussion, one should ask after one's counterpart's health and life. Men should be careful not to bring up the subject of women unless one's counterpart does so first.
- In the realm of personal protocol, one should not enter a room or home without knocking or coughing to announce one's presence. One should also not shout, laugh too loudly or sing during meal times. Note that it is appropriate to cover the mouth when laughing.
- Generally, visitors are urged to acquaint themselves with the calendar and traditions of Islam, such as the fasting, daily prayer and practices. Praying five times daily, for example, is customary and affects the schedule of all events and practices in countries with Muslim populations. During the period of Ramadan, for instance, fasting and prayer is mandatory for Muslims.

- Among more traditional Muslims, one should always use the right hand in preference to the left. The left hand is considered unclean in the Muslim world and as such, one should never eat with the left hand. Likewise, one should avoid gesturing with the left hand while making sure that gifts are received with the right hand. Of course, it is acceptable to use both hands when one is insufficient. One should also avoid pointing at another person, and one should never use the North American "thumbs up" gesture as is considered to be vulgar throughout the Muslim world.
 - Uzbekistan is a predominantly Muslim culture and although it is not considered to be a fundamentalist Islamic country, clothing should be appropriate to this environment. Business wear is typically more conventional; suits are the norm for both men and women, although more casual attire may also be permissible. Western women should try to be more restrained in regard to makeup and jewelry. Both men and women should dress modestly. Tight, revealing clothing is simply not acceptable, while shorts, bikinis and short hems are objectionable. Necklines should be high and sleeves should come to the elbows. Hemlines should be well below the knee, if not ankle length. While the rules for men's attire is not as strict, men must keep their chest covered in public and should never wear shorts in public.
-

Travel Information

Please Note

This is a generalized travel guide and it is intended to coalesce several resources, which a traveler might find useful, regardless of a particular destination. As such, it does not include travel warnings for specific "hot spot" destinations.

For travel alerts and warnings, please see the United States Department of State's listings available at URL:

<http://travel.state.gov/content/passports/english/alertswarnings.html>

Please note that travel to the following countries, based on these warnings, is ill-advised, or should be undertaken with the utmost precaution:

Afghanistan, Algeria, Burundi, Cameroon, Central African Republic, Chad, Colombia, Democratic Republic of Congo, Djibouti, El Salvador, Eritrea, Ethiopia, Guinea, Honduras, Iraq, Iran, Lebanon, Liberia, Libya, Mali, Mauritania, Mexico, Nepal, Niger, Nigeria, North Korea, Pakistan, Palestinian Territories of West Bank and Gaza, Philippines areas of Sulu Archipelago, Mindanao, and southern Sulu Sea, Saudi Arabia, Sierra Leone, Somalia, South Sudan, Sudan, Syria, Ukraine, Venezuela, and Yemen.

International Travel Guide

Checklist for Travelers

1. Take out travel insurance to cover hospital treatment or medical evacuation. Overseas medical costs are expensive to most international travelers, where one's domestic, nationalized or even private health insurance plans will not provide coverage outside one's home country. Learn about "reciprocal insurance plans" that some international health care companies might offer.
2. Make sure that one's travel insurance is appropriate. If one intends to indulge in adventurous activities, such as parasailing, one should be sure that one is fully insured in such cases. Many traditional insurance policies do not provide coverage in cases of extreme circumstances.
3. Take time to learn about one's destination country and culture. Read and learn about the place one is traveling. Also check political, economic and socio-cultural developments at the destination by reading country-specific travel reports and fact sheets noted below.
4. Get the necessary visas for the country (or countries) one intends to visit - but be aware that a visa does not guarantee entry. A number of useful sites regarding visa and other entry requirements are noted below.
5. Keep in regular contact with friends and relatives back at home by phone or email, and be sure to leave a travel itinerary.
6. Protect one's personal information by making copies of one's passport details, insurance policy, travelers checks and credit card numbers. Taking copies of such documents with you, while leaving another collection copies with someone at home is also good practice for travelers. Taking copies of one's passport photograph is also recommended.
7. Stay healthy by taking all possible precautions against illness. Also, be sure to take extra supplies of prescription drugs along for the trip, while also taking time to pack general pharmaceutical supplies, such as aspirin and other such painkillers, bandages, stomach ailment medication, anti-inflammatory medication and anti-bacterial medication.
8. Do not carry illicit drugs. Understand that the punishment for possession or use of illegal drugs in some countries may be capital punishment. Make sure your prescription drugs are legal in the countries you plan to visit.
9. Know the laws of one's destination country and culture; be sure to understand the repercussions of breaking those laws and regulations. Often the transparency and freedoms of the juridical system at home is not consistent with that of one's destination country. Become aware of these complexities and subtleties before you travel.
10. For longer stays in a country, or where the security situation is volatile, one should register one's self and traveling companions at the local embassy or consulate of one's country of citizenship.
11. Women should take care to be prepared both culturally and practically for traveling in a

different country and culture. One should be sure to take sufficient supplies of personal feminine products and prescription drugs. One should also learn about local cultural standards for women, including norms of dressing. Be aware that it is simply inappropriate and unsafe for women to travel alone in some countries, and take the necessary precautions to avoid risk-filled situations.

12. If one is traveling with small children, one should pack extra supplies, make arrangements with the travel carrier for proper seating that would adequately accommodate children, infants or toddlers. Note also that whether one is male or female, traveling with children means that one's hands are thus not free to carry luggage and bags. Be especially aware that this makes one vulnerable to pickpockets, thieves and other sorts of crime.

13. Make proper arrangements for accommodations, well in advance of one's arrival at a destination. Some countries have limited accommodation, while others may have culturally distinctive facilities. Learning about these practicalities before one travels will greatly aid the enjoyment of one's trip.

14. Travel with different forms of currency and money (cash, traveler's checks and credit cards) in anticipation that venues may not accept one or another form of money. Also, ensuring that one's financial resources are not contained in one location, or by one person (if one is traveling with others) can be a useful measure, in the event that one loses a wallet or purse.

15. Find out about transportation in the destination country. In some places, it might be advisable to hire a local driver or taxi guide for safety reasons, while in other countries, enjoying one's travel experience may well be enhanced by renting a vehicle and seeing the local sights and culture independently. Costs may also be prohibitive for either of these choices, so again, prior planning is suggested.

Tips for Travelers

- Get adequate travel insurance including medical insurance.
- Check with your embassy, consulate, or appropriate government institution related to travel before traveling.
- Bring enough money for your stay.
- Keep belongings in a safe place.
- Enter next of kin details into the back of your passport.
- Be careful about taking photographs especially near airports/military barracks/police stations.
- Only change money through official exchange booths.

- Avoid obvious shows of wealth (especially in rural areas).
- Register with the Embassy even if only a short term visitor and inform the Embassy of any changes to your itinerary.
- Make a copy of your passport and driving license.
- Don't carry drugs; penalties are severe.
- Don't overstay your visa and ensure you have onward visas for other countries if traveling elsewhere.

Business Culture: Information for Business Travelers

While Tashkent is a fairly westernized, cosmopolitan city, the rest of Uzbekistan, especially in rural areas, tends to be a rather conservative, tolerant and hospital, Muslim-based culture. This means that Westerners, particularly women, should be aware of different standards of dress, behavior, and living that are the norms here.

Western business attire is appropriate for most business meetings and in Tashkent western-style clothing is appropriate. Dress for men is more or less the same throughout the country. For women, however, there are two dress codes, one for Tashkent and one everywhere else. In Tashkent it is acceptable to wear short skirts, tops with bared shoulders, and pants. Outside of Tashkent the dress is much more conservative. A dress or skirt should be below the knee; short sleeves are fine, but the shoulder and front should be fully covered. Pants are acceptable if covered by a long top, as is done in Uzbek national dress. Women do not need to cover their heads, as is the case in some Muslim countries.

There is no question that Uzbekistan is a male-dominated society. When there are large social gatherings of mixed company, the women and men usually sit in separate groupings. Exceptions are made for "honored foreign guests", and this practice does not apply to business gatherings. Much of the local social life revolves are the chai-khonas (tea-houses). While foreign women are allowed in, the chai-khonas basically serve as a men's club where they congregate and talk. Local women do not frequent the establishments. Women should take the lead in greetings and in offering a handshake; traditional Uzbek women do not normally shake hands, and well-behaved men do not

take the lead in greeting unknown women.

If possible, make up business cards and company literature in Russian and/or Uzbek.

Diseases/Health Data

Please Note: Most of the entry below constitutes a generalized health advisory, which a traveler might find useful, regardless of a particular destination.

As a supplement, however, the reader will also find below a list of countries flagged with current health notices and alerts issued by the Centers for Disease Control and Prevention (CDC). Please note that travel to the following countries, based on these 3 levels of warnings, is ill-advised, or should be undertaken with the utmost precaution:

Level 3 (highest level of concern; avoid non-essential travel) --

Guinea - Ebola
Liberia - Ebola
Nepal - Earthquake zone
Sierra Leone - Ebola

Level 2 (intermediate level of concern; use utmost caution during travel) --

Cameroon - Polio
Somalia - Polio
Vanuatu - Tropical Cyclone zone
Throughout Middle East and Arabia Peninsula - MERS ((Middle East Respiratory Syndrome)

Level 1 (standard level of concern; use practical caution during travel) -

Australia - Ross River disease
Bosnia-Herzegovina - Measles
Brazil - Dengue Fever
Brazil - Malaria
Brazil - Zika
China - H7N9 Avian flu
Cuba - Cholera
Egypt - H5N1 Bird flu
Ethiopia - Measles
Germany - Measles
Japan - Hand, foot, and mouth disease (HFMD)
Kyrgyzstan - Measles
Malaysia -Dengue Fever
Mexico - Chikungunya
Mexico - Hepatitis A
Nigeria - Meningitis
Philippines - Measles
Scotland - Mumps
Singapore - Hand, foot, and mouth disease (HFMD)
South Korea - MERS ((Middle East Respiratory Syndrome)
Throughout Caribbean - Chikungunya
Throughout Central America - Chikungunya
Throughout South America - Chikungunya
Throughout Pacific Islands - Chikungunya

For specific information related to these health notices and alerts please see the CDC's

listing available at URL:

<http://wwwnc.cdc.gov/travel/notices>

Health Advisory for Uzbekistan

Food and waterborne diseases are the number one cause of illness in travelers. Travelers' diarrhea can be caused by viruses, bacteria, or parasites, which are found throughout Eastern Europe and can contaminate food or water. Infections may cause diarrhea and vomiting (*E. coli*, *Salmonella*, cholera, and parasites), fever (typhoid fever and toxoplasmosis), or liver damage (hepatitis). Make sure your food and drinking water are safe. (See below.)

Malaria is a preventable infection that can be fatal if left untreated. Prevent infection by taking prescription antimalarial drugs and protecting yourself against mosquito bites (see below). Risk for malaria exists only in small southern border areas of Azerbaijan and Tajikistan. Travelers to these areas should take chloroquine to prevent malaria. For more detailed information about malaria in this region, see Malaria Risk and Prevention in Eastern Europe and the Newly Independent States (<http://www.cdc.gov/travel/regionalmalaria/easteurp.htm>).

A certificate of yellow fever vaccination may be required for entry into certain of these countries if you are coming from a tropical South American or sub-Saharan African country. (There is no risk for yellow fever in Eastern European and NIS countries.) For detailed information, see Comprehensive Yellow Fever Vaccination Requirements (<http://www.cdc.gov/travel/yelfever.htm>).

An outbreak of diphtheria is occurring in all the states of the former Soviet Union. Travelers to these areas should be sure that their diphtheria immunization is up to date.

Tickborne encephalitis, a viral infection of the central nervous system occurs chiefly in Central and Western Europe. Travelers are at risk who visit or work in forested areas during the summer months and who consume unpasteurized dairy products. Vaccine for this disease is not available in the United States at this time. To prevent tickborne encephalitis, as well as Lyme disease, travelers should take precautions to prevent tick bites (see below).

Because motor vehicle crashes are a leading cause of injury among travelers, walk and drive defensively. Avoid nighttime travel if possible and always use seat belts.

CDC Recommends the Following Vaccines (as Appropriate for Age):

See your doctor at least 4-6 weeks before your trip to allow time for shots to take effect.

- Hepatitis A or immune globulin (IG).
- Hepatitis B, if you might be exposed to blood (for example, health-care workers), have sexual contact with the local population, stay longer than 6 months, or be exposed through medical treatment.
- Rabies, if you might be exposed to wild or domestic animals through your work or recreation.
- Typhoid, particularly if you are visiting developing countries in this region.
- As needed, booster doses for tetanus-diphtheria, measles, and a one-time dose of polio vaccine for adults. Hepatitis B vaccine is now recommended for all infants and for 11- to 12-year-olds who did not receive the series as infants.

To Stay Healthy, Do:

- Wash hands often with soap and water.
- Drink only bottled or boiled water, or carbonated (bubbly) drinks in cans or bottles. Avoid tap water, fountain drinks, and ice cubes. If this is not possible, make water safer by BOTH filtering through an "absolute 1-micron or less" filter AND adding iodine tablets to the filtered water. "Absolute 1-micron filters" are found in camping/outdoor supply stores.
- Eat only thoroughly cooked food or fruits and vegetables you have peeled yourself. Remember: boil it, cook it, peel it, or forget it.
- If you are going to visit risk areas for malaria, take your malaria prevention medication before, during, and after travel, as directed. (See your doctor for a prescription.)
- Protect yourself from insects by remaining in well-screened areas, using repellents (applied sparingly at 4-hour intervals), and wearing long-sleeved shirts and long pants tucked into boots or socks as a deterrent to ticks.
- To prevent fungal and parasitic infections, keep feet clean and dry, and do not go barefoot.
- Always use latex condoms to reduce the risk of HIV and other sexually transmitted diseases.

To Avoid Getting Sick:

- Don't eat food purchased from street vendors.
- Don't drink beverages with ice.
- Don't eat dairy products unless you know they have been pasteurized.
- Don't share needles with anyone.
- Don't handle animals (especially monkeys, dogs, and cats), to avoid bites and serious diseases (including rabies and plague).

What You Need To Bring with You:

- Long-sleeved shirt and long pants to wear while outside whenever possible, to prevent illnesses carried by insects.
- Insect repellent containing DEET (diethylmethylnolamamide), in 30%-35% strength for adults and 6%-10% for children. The insecticide permethrin applied to clothing is an effective deterrent to ticks.

- Over-the-counter antidiarrheal medicine to take if you have diarrhea.
- Iodine tablets and water filters to purify water if bottled water is not available. See above for more information about water filters.
- Sunblock, sunglasses, hat.
- Prescription medications: make sure you have enough to last during your trip, as well as a copy of the prescription(s).

After You Return Home:

If you have visited an area where there is risk for malaria, continue taking your malaria medication weekly for 4 weeks after you leave the area.

If you become ill after your trip-even as long as a year after you return-tell your doctor where you have traveled.

For More Information:

Ask your doctor or check the CDC web sites for more information about how to protect yourself against diseases that occur in Eastern Europe and the Newly Independent States (NIS).

For information about diseases-

Carried by Insects

Lyme disease, Malaria

Carried in Food or Water

Bovine spongiform encephalopathy ("mad cow disease"), Cholera, *Escherichia coli*, diarrhea, Hepatitis A, Typhoid Fever

Person-to-Person Contact

Hepatitis B, HIV/AIDS

For more information about these and other diseases, also check the Diseases (<http://www.cdc.gov/travel/diseases.htm>) section and the Health Topics A - Z (<http://www.cdc.gov/health/diseases.htm>).

Note:

Uzbekistan is located in the Eastern Europe and Newly Independent States (NIS) health region.

Chapter 6

Environmental Overview

Environmental Issues

General Overview:

Most of Uzbekistan 's environmental issues are a product of the Soviet era. The centrally planned economy was based almost entirely on cotton production; the huge irrigation system built to sustain this crop led to both water shortages and increased soil salinity. The heavy use of fertilizers and pesticides adversely affected the air, soil, ground and lake water, and human health. In particular, the Aral Sea was contaminated by concentrations of chemical pesticides, including DDT. Agricultural chemicals also increased soil salinization. Over time, this led to a contraction of the Aral Sea. The increasingly exposed seabed then began to erode, contributing to desertification.

Current Issues:

- desertification
- water pollution from industrial wastes
- soil salinization
- soil contamination
- contamination of the Aral Sea by chemicals, fertilizers, and other toxins
- health complications from exposure to toxins

Global Environmental Snapshot

Introduction

The countries of the world face many environmental challenges in common. Nevertheless, the nature and intensity of problem vary from region to region, as do various countries' respective capacities, in terms of affluence and infrastructure, to remediate threats to environmental quality.

Consciousness of perils affecting the global environment came to the fore in the last third or so of the 20th century has continued to intensify well into the new millennium. According to the United Nations Environment Programme, considerable environmental progress has been made at the level of institutional developments, international cooperation accords, and public participation. Approximately two-dozen international environmental protection accords with global implications have been promulgated since the late 1970s under auspices of the United Nations and other international organizations, together with many additional regional agreements. Attempts to address and rectify environmental problems take the form of legal frameworks, economic instruments,

environmentally sound technologies and cleaner production processes as well as conservation efforts. Environmental impact assessments have increasingly been applied across the globe.

Environmental degradation affects the quality, or aesthetics, of human life, but it also displays potential to undermine conditions necessary for the sustainability of human life. Attitudes toward the importance of environmental protection measures reflect ambivalence derived from this bifurcation. On one hand, steps such as cleaning up pollution, dedicating parkland, and suchlike, are seen as embellishments undertaken by wealthy societies already assured they can successfully perform those functions deemed, ostensibly, more essential-for instance, public health and education, employment and economic development. On the other hand, in poorer countries, activities causing environmental damage-for instance the land degradation effects of unregulated logging, slash-and-burn agriculture, overgrazing, and mining-can seem justified insofar as such activities provide incomes and livelihoods.

Rapid rates of resource depletion are associated with poverty and high population growth, themselves correlated, whereas consumption per capita is much higher in the most developed countries, despite these nations' recent progress in energy efficiency and conservation. It is impossible to sequester the global environmental challenge from related economic, social and political challenges.

First-tier industrialized countries have recently achieved measurable decreases in environmental pollution and the rate of resource depletion, a success not matched in middle income and developing countries. It is believed that the discrepancy is due to the fact that industrialized countries have more developed infrastructures to accommodate changes in environmental policy, to apply environmental technologies, and to invest in public education. The advanced industrialized countries incur relatively lower costs in alleviating environmental problems, in comparison to developing countries, since in the former even extensive environmental programs represent a rather minuscule percentage of total expenditures. Conversely, budget constraints, lagged provision of basic services to the population, and other factors such as debt service and militarization may preclude institution of minimal environmental protection measures in the poorest countries.

A synopsis for the current situation facing each region of the world follows:

Regional Synopsis: Africa

The African continent, the world's second-largest landmass, encompasses many of the world's least developed countries. By global standards, urbanization is comparatively low but rising at a rapid rate. More heavily industrialized areas at the northern and southern ends of the continent experience the major share of industrial pollution. In other regions the most serious environmental problems typically stem from inefficient subsistence farming methods and other forms of land

degradation, which have affected an increasingly extensive area under pressure of a widely impoverished, fast-growing population. Africa's distribution of natural resources is very uneven. It is the continent at greatest risk of desertification, especially in the Sahel region at the edge of the Sahara but also in other dry-range areas. Yet at the same time, Africa also harbors some of the earth's richest and most diverse biological zones.

Key Points:

Up to half a billion hectares of African land are moderately to severely degraded, an occurrence reflecting short-fallow shifting cultivation and overgrazing as well as a climatic pattern of recurrent droughts.

Soil degradation is severe along the expanse directly south of the Sahara, from the west to the east coasts. Parts of southern Africa, central-eastern Africa, and the neighboring island of Madagascar suffer from serious soil degradation as well.

Africa contains about 17 percent of the world's forest cover, concentrated in the tropical belt of the continent. Many of the forests, however, are severely depleted, with an estimated 70 percent showing some degree of degradation.

Population growth has resulted in continuing loss of arable land, as inefficient subsistence farming techniques affect increasingly extensive areas. Efforts to implement settled, sustainable agriculture have met with some recent success, but much further progress in this direction is needed. Especially in previously uninhabited forestlands, concern over deforestation is intensifying.

By contrast, the African savanna remains the richest grassland in the world, supporting a substantial concentration of animal and plant life. Wildlife parks are sub-Saharan Africa's greatest tourist attraction, and with proper management-giving local people a stake in conservation and controlling the pace of development-could greatly enhance African economies.

Significant numbers of mammal species in parts of northern, southern and eastern Africa are currently threatened, while the biological diversity in Mauritania and Madagascar is even further compromised with over 20 percent of the mammal species in these two countries currently under threat.

With marine catch trends increasing from 500,000 metric tons in the 1950s to over 3,000,000 metric tons by 2000, there was increasing concern about the reduction in fisheries and marine life, should this trend continue unabated.

Water resource vulnerability is a major concern in northeastern Africa, and a moderate concern across the rest of the continent. An exception is central Africa, which has plentiful water supplies.

Many Africans lack adequate access to resources, not just (if at all) because the resources are unevenly distributed geographically, but also through institutional failures such as faulty land tenure systems or political upheaval. The quality of Africa's natural resources, despite their spotty distribution, is in fact extraordinarily rich. The infrastructure needed to protect and benefit from this natural legacy, however, is largely lacking.

Regional Synopsis: Asia and the Pacific

Asia-earth's largest landmass-and the many large and nearly innumerable small islands lying off its Pacific shore display extraordinarily contrasting landscapes, levels of development, and degrees of environmental stress. In the classification used here, the world's smallest continent, Australia, is also included in the Asia-Pacific region.

The Asia-Pacific region is home to 9 of the world's 14 largest urban areas, and as energy use for utilities, industry and transport increases in developing economies, urban centers are subject to worsening air quality. Intense population density in places such as Bangladesh or Hong Kong is the quintessential image many people have of Asia, yet vast desert areas such as the Gobi and the world's highest mountain range, the Himalayas, span the continent as well. Forested areas in Southeast Asia and the islands of Indonesia and the Philippines were historically prized for their tropical hardwood, but in many places this resource is now severely depleted. Low-lying small island states are extremely vulnerable to the effects of global warming, both rising sea levels and an anticipated increase in cyclones.

Key Points:

Asian timber reserves are forecast to be depleted in the next 40 years. Loss of natural forest is irreversible in some areas, but plantation programs to restore tree cover may ameliorate a portion of the resulting land degradation.

Increased usage of fossil fuels in China and other parts of southern Asia is projected to result in a marked increase in emissions, especially in regard to carbon dioxide. The increased usage of energy has led to a marked upsurge in air pollution across the region.

Acidification is an emerging problem regionally, with sulfur dioxide emissions expected to triple by 2010 if the current growth rate is sustained. China, Thailand, India, and Korea seem to be suffering from particularly high rates of acid deposition. By contrast, Asia's most highly developed economy, Japan, has effected substantial improvements in its environmental indicators.

Water pollution in the Pacific is an urgent concern since up to 70 percent of the water discharged

into the region's waters receives no treatment. Additionally, the disposal of solid wastes, in like manner, poses a major threat in a region with many areas of high population density.

The Asia-Pacific region is the largest expanse of the world's land that is adversely affected by soil degradation.

The region around Australia reportedly suffers the largest degree of ozone depletion.

The microstates of the Pacific suffer land loss due to global warming, and the consequent rise in the levels of ocean waters. A high-emissions scenario and anthropogenic climate impact at the upper end of the currently predicted range would probably force complete evacuation of the lowest-elevation islands sometime in this century.

The species-rich reefs surrounding Southeast Asia are highly vulnerable to the deleterious effects of coastal development, land-based pollution, over-fishing and exploitative fishing methods, as well as marine pollution from oil spills and other activities.

With marine catch trends increasing from 5,000,000 metric tons in the 1950s to over 20,000,000 metric tons by 2000, there was increasing concern about the reduction in fisheries and marine life, should this trend continue unabated.

Significant numbers of mammal species in parts of China and south-east Asia are currently threatened, while the biological diversity in India, Japan, Australia, the Philippines, Indonesia and parts of Malaysia is even further compromised with over 20 percent of the mammal species in these countries currently under threat.

Water resource vulnerability is a serious concern in areas surrounding the Indian subcontinent.

Regional Synopsis: Central Asia

The Central Asian republics, formerly in the Soviet Union, experience a range of environmental problems as the result of poorly executed agricultural, industrial, and nuclear programs during the Soviet era. Relatively low population densities are the norm, especially since upon the breakup of the U.S.S.R. many ethnic Russians migrated back to European Russia. In this largely semi-arid region, drought, water shortages, and soil salinization pose major challenges.

Key Points:

The use of agricultural pesticides, such as DDT and other chemicals, has contributed to the contamination of soil and groundwater throughout the region.

Land and soil degradation, and in particular, increased salinization, is mostly attributable to faulty irrigation practices.

Significant desertification is also a problem in the region.

Air pollution is prevalent, mostly due to use of low octane automobile fuel.

Industrial pollution of the Caspian Sea and the Aral Sea, as a result of industrial effluents as well as mining and metal production, presents a challenge to the countries bordering these bodies of water.

One of the most severe environmental problems in the region is attributable to the several billion tons of hazardous materials stored in landfills across Central Asia.

Uzbekistan's particular problem involves the contraction of the Aral Sea, which has decreased in size by a third, as a consequence of river diversions and poor irrigation practices. The effect has been the near-total biological destruction of that body of water.

Kazakhstan, as a consequence of being the heartland of the former Soviet Union's nuclear program, has incurred a high of cancerous malignancies, biogenetic abnormalities and radioactive contamination.

While part of the Soviet Union, the republics in the region experienced very high levels of greenhouse gas emissions, as a consequence of rapid industrialization using cheap but dirty energy sources, especially coal.

By contrast, however, there have recently been substantial reductions in the level of greenhouse gas emissions, especially those attributable to coal burning, with further decreases anticipated over the next decade. These changes are partially due to the use of cleaner energy technologies, such as natural gas, augmented by governmental commitment to improving environmental standards.

Regional Synopsis: Europe

Western Europe underwent dramatic transformation of its landscape, virtually eliminating large-scale natural areas, during an era of rapid industrialization, which intensified upon its recovery from World War II. In Eastern Europe and European Russia, intensive land development has been less prevalent, so that some native forests and other natural areas remain. Air and water pollution from use of dirty fuels and industrial effluents, however, are more serious environmental problems in Eastern than in Western Europe, though recent trends show improvement in many indicators. Acid rain has inflicted heavy environmental damage across much of Europe, particularly on forests.

Europe and North America are the only regions in which water usage for industry exceeds that for agriculture, although in Mediterranean nations agriculture is the largest water consumer.

Key Points:

Europe contributes 36 percent of the world's chlorofluorocarbon emissions, 30 percent of carbon dioxide emissions, and 25 percent of sulfur dioxide emissions.

Sulfur and nitrogen oxide emissions are the cause of 30 to 50 percent of Central and Eastern Europe's deforestation.

Acid rain has been an environmental concern for decades and continues to be a challenge in parts of Western Europe.

Overexploitation of up to 60 percent of Europe's groundwater presents a problem in industrial and urban areas.

With marine catch trends increasing from 5,000,000 metric tons in the 1950s to over 20,000,000 metric tons by 2000, there was increasing concern about the reduction in fisheries and marine life, should this trend continue unabated.

Significant numbers of mammal species in parts of western Europe, Eastern Europe and Russia are currently threatened, while the biological diversity on the Iberian Peninsula is even further compromised with over 40 percent of the mammal species in this region currently under threat. As a result, there has been a 10 percent increase in protected areas of Europe.

A major environmental issue for Europe involves the depletion of various already endangered or threatened species, and most significantly, the decline of fish stocks. Some estimates suggest that up to 50 percent of the continent's fish species may be considered endangered species. Coastal fisheries have been over-harvested, resulting in catch limits or moratoriums on many commercially important fish species.

Fortunately, in the last few years, these policies have started to yield measurable results with decreasing trends in marine fish catch.

Recently, most European countries have adopted cleaner production technologies, and alternative methods of waste disposal, including recycling.

The countries of Eastern Europe have made air quality a major environmental priority. This is exemplified by the Russian Federation's addition to the 1995 "Berlin Mandate" (transnational legislation based on resolutions of the Rio Earth Summit) compelling nations to promote "carbon

sinks" to absorb greenhouse gases.

On a relative basis, when compared with the degree of industrial emissions emitted by many Eastern European countries until the late 1980s, there has been some marked increase in air quality in the region, as obsolete plants are closed and a transition to cleaner fuels and more efficient energy use takes place.

Regional Synopsis: The Middle and Near East

Quite possibly, the Middle East will exemplify the adage that, as the 20th century was a century fixated on oil, the 21st century will be devoted to critical decisions about water. Many (though far from all) nations in the Middle East rank among those countries with the largest oil and gas reserves, but water resources are relatively scarce throughout this predominantly dry region. Effects of global warming may cause moderately high elevation areas that now typically receive winter "snowpack" to experience mainly rain instead, which would further constrain dry-season water availability. The antiquities and religious shrines of the region render it a great magnet for tourism, which entails considerable economic growth potential but also intensifies stresses on the environment.

Key Points:

Water resource vulnerability is a serious concern across the entire region. The increased usage of, and further demand for water, has exacerbated long-standing water scarcity in the region. For instance, river diversions and industrial salt works have caused the Dead Sea to shrink by one-third from its original surface area, with further declines expected.

The oil industry in the region contributes to water pollution in the Persian Gulf, as a result of oil spills, which have averaged 1.2 million barrels of oil spilt per year (some sources suggest that this figure is understated). The consequences are severe because even after oil spills have been cleaned up, environmental damage to the food webs and ecosystems of marine life will persist for a prolonged period.

The region's coastal zone is considered one of the most fragile and endangered ecosystems of the world. Land reclamation, shoreline construction, discharge of industrial effluents, and tourism (such as diving in the Red Sea) contribute to widespread coastal damage.

Significant numbers of mammal species in parts of the Middle East are currently threatened.

Since the 1980s, 11 percent of the region's natural forest has been depleted.

Regional Synopsis: Latin America and the Caribbean

The Latin American and Caribbean region is characterized by exceedingly diverse landforms that have generally seen high rates of population growth and economic development in recent decades. The percentage of inhabitants residing in urban areas is quite high at 73.4 percent; the region includes the megacities of Mexico City, Sao Paulo, and Rio de Janeiro. The region also includes the world's second-highest mountain range, the Andes; significant expanses of desert and grassland; the coral reefs of the Caribbean Sea; and the world's largest contiguous tropical forest in the Amazon basin. Threats to the latter from subsistence and commercial farming, mineral exploitation and timbering are well publicized. Nevertheless, of eight countries worldwide that still retain at least 70 percent of their original forest cover, six are in Latin America. The region accounts for nearly half (48.3 percent) of the world's greenhouse gas emissions derived from land clearing, but as yet a comparatively minuscule share (4.3 percent) of such gases from industrial sources.

Key Points:

Although Latin America is one of the most biologically diverse regions of the world, this biodiversity is highly threatened, as exemplified by the projected extinction of up to 100,000 species in the next few decades. Much of this loss will be concentrated in the Amazon area, although the western coastline of South America will also suffer significant depletion of biological diversity. The inventory of rainforest species with potentially useful commercial or medical applications is incomplete, but presumed to include significant numbers of such species that may become extinct before they are discovered and identified.

Up to 50 percent of the region's grazing land has lost its soil fertility as a result of soil erosion, salinization, alkalinization and overgrazing.

The Caribbean Sea, the Atlantic Ocean, and the Pacific Ocean have all been contaminated by agricultural wastes, which are discharged into streams that flow into these major waters. Water pollution derived from phosphorous, nitrates and pesticides adversely affects fish stocks, contributes to oxygen depletion and fosters overgrowth of aquatic vegetation. Marine life will continue to be severely compromised as a result of these conditions.

Due to industrial development in the region, many beaches of eastern Latin America and the Caribbean suffer from tar deposits.

Most cities in the region lack adequate sewage treatment facilities, and rapid migration of the rural poor into the cities is widening the gap between current infrastructure capacity and the much greater level needed to provide satisfactory basic services.

The rainforest region of the Amazon Basin suffers from dangerously high levels of deforestation, which may be a significant contributory factor to global warming or "the greenhouse effect." In the late 1990s and into the new millennium, the rate of deforestation was around 20 million acres of rainforest being destroyed annually.

Deforestation on the steep rainforest slopes of Caribbean islands contributes to soil erosion and landslides, both of which then result in heavy sedimentation of nearby river systems. When these sedimented rivers drain into the sea and coral reefs, they poison the coral tissues, which are vital to the maintenance of the reef ecosystem. The result is marine degradation and nutrient depletion. Jamaica's coral reefs have never quite recovered from the effects of marine degradation.

The Southern Cone of Latin America (Argentina, Brazil, Chile, Paraguay, and Uruguay) suffers the effects of greatly increased ultraviolet-B radiation, as a consequence of more intense ozone depletion in the southern hemisphere.

Water resource vulnerability is an increasingly major concern in the northwestern portion of South America.

Regional Synopsis: North America

North American nations, in particular the United States and Canada, rank among the world's most highly developed industrial economies—a fact which has generated significant pollution problems, but also financial resources and skills that have enabled many problems to be corrected. Although efforts to promote energy efficiency, recycling, and suchlike have helped ease strains on the environment in a part of the world where per capita consumption levels are high, sprawling land development patterns and recent preferences many households have demonstrated for larger vehicles have offset these advances.

Meanwhile, a large portion of North America's original forest cover has been lost, though in many cases replaced by productive second-growth woodland. In recent years, attitudes toward best use of the region's remaining natural or scenic areas seem to be shifting toward recreation and preservation and away from resource extraction. With increasing attention on the energy scarcity in the United States, however, there is speculation that this shift may be short-lived. Indeed, the energy shortage on the west coast of the United States and associated calls for energy exploration, indicate a possible retrenchment toward resource extraction. At the same time, however, it has also served to highlight the need for energy conservation as well as alternative energy sources.

Despite generally successful anti-pollution efforts, various parts of the region continue to suffer significant air, water and land degradation from industrial, vehicular, and agricultural emissions and

runoff. Mexico, as a middle-income country, displays environmental problems characteristic of a developing economy, including forest depletion, pollution from inefficient industrial processes and dirty fuels, and lack of sufficient waste-treatment infrastructure.

Key Points:

Because of significantly greater motor vehicle usage in the United States (U.S.) than in the rest of the world, the U.S. contribution of urban air pollution and greenhouse gas emissions, especially carbon dioxide, is disproportionately high in relation to its population.

Acid rain is an enduring issue of contention in the northeastern part of the United States, on the border with Canada.

Mexico's urban areas suffer extreme air pollution from carbon monoxide, nitrogen oxides, sulfur dioxide, and other toxic air pollutants. Emissions controls on vehicles are in their infancy, compared to analogous regulations in the U.S.

The cities of Mexico, including those on the U.S. border, also discharge large quantities of untreated or poorly treated sewage, though officials are currently planning infrastructure upgrades.

Deforestation is noteworthy in various regions of the U.S., especially along the northwest coastline. Old growth forests have been largely removed, but in the northeastern and upper midwestern sections of the United States, evidence suggests that the current extent of tree cover probably surpasses the figure for the beginning of the 20th century.

Extreme weather conditions in the last few years have resulted in a high level of soil erosion along the north coast of California; in addition, the coastline itself has shifted substantially due to soil erosion and concomitant landslides.

Agricultural pollution-including nitrate contamination of well water, nutrient runoff to waterways, and pesticide exposure-is significant in various areas. Noteworthy among affected places are California's Central Valley, extensive stretches of the Midwest, and land in the Chesapeake Bay watershed.

Inland waterways, especially around the Great Lakes, have substantially improved their water quality, due to concentrated efforts at reducing water pollution by governmental, commercial and community representatives. Strict curbs on industrial effluents and near-universal implementation of sewage treatment are the chief factors responsible for this improvement.

A major environmental issue for Canada and the United States involves the depletion of various

already endangered or threatened species, and most significantly, the decline of fish stocks. Coastal fisheries have been over-harvested, resulting in catch limits or moratoriums on many commercially important fish species. In the last few years, these policies have started to yield measurable results with decreasing trends in marine fish catch.

Due to the decay of neighboring ecosystems in Central America and the Caribbean, the sea surrounding Florida has become increasingly sedimented, contributing to marine degradation, nutrient depletion of the ecosystem, depletion of fish stocks, and diseases to coral species in particular.

Polar Regions

Key Points:

The significant rise in sea level, amounting 10 to 25 centimeters in the last 100 years, is due to the melting of the Arctic ice sheets, and is attributed to global warming.

The Antarctic suffers from a significant ozone hole, first detected in 1976. By 1985, a British scientific team reported a 40 percent decrease in usual regeneration rates of the ozone. Because a sustained increase in the amount of ultraviolet-B radiation would have adverse consequences upon all planetary life, recent environmental measures have been put into effect, aimed at reversing ozone depletion. These measures are projected to garner significant results by 2050.

Due to air and ocean currents, the Arctic is a sink for toxic releases originally discharged thousands of miles away. Arctic wildlife and Canada's Inuit population have higher bodily levels of contaminants such as PCB and dioxin than those found in people and animals in much of the rest of the world.

Global Environmental Concepts

-

1. Global Warming and Greenhouse Gases

The Greenhouse Effect:

In the early 19th century, the French physicist, Jean Fourier, contended that the earth's atmosphere functions in much the same way as the glass of a greenhouse, thus describing what is now understood as the "greenhouse effect." Put simply, the "greenhouse effect" confines some of the sun's energy to the earth, preserving some of the planet's warmth, rather than allowing it to flow back into space. In so doing, all kinds of life forms can flourish on earth. Thus, the "greenhouse effect" is necessary to sustain and preserve life forms and ecosystems on earth.

In the late 19th century, a Swedish chemist, Svante Arrhenius, noticed that human activities, such as the burning of coal and other fossil fuels for heat, and the removal of forested lands for urban development, led to higher concentrations of greenhouse gases, like carbon dioxide and methane, in the atmosphere. This increase in the levels of greenhouse gases was believed to advance the "greenhouse effect" exponentially, and might be related to the trend in global warming.

In the wake of the Industrial Revolution, after industrial development took place on a large scale and the total human population burgeoned simultaneously with industrialization, the resulting increase in greenhouse gas emissions could, many scientists believe, be significant enough to have some bearing on climate. Indeed, many studies in recent years support the idea that there is a linkage between human activities and global warming, although there is less consensus on the extent to which this linkage may be relevant to environmental concerns.

That said, some scientists have argued that temperature fluctuations have existed throughout the evolution of the planet. Indeed, Dr. S. Fred Singer, the president of the Science and Environment Policy Project has noted that 3,000-year-old geological records of ocean sediment reveal changes in the surface temperature of the ocean. Hence, it is possible that climate variability is merely a normal fact of the planet's evolution. Yet even skeptics as to anthropogenic factors concur that any substantial changes in global temperatures would likely have an effect upon the earth's ecosystems, as well as the life forms that inhabit them.

The Relationship Between Global Warming and Greenhouse Gases:

A large number of climatologists believe that the increase in atmospheric concentrations of "greenhouse gas emissions," mostly a consequence of human activities such as the burning of fossil fuels, are contributing to global warming. The cause notwithstanding, the planet has reportedly warmed 0.3°C to 0.6°C over the last century. Indeed, each year during the 1990s was one of the very warmest in the 20th century, with the mean surface temperature for 1999 being the fifth warmest on record since 1880.

In early 2000, a panel of atmospheric scientists for the National Research Council concluded in a report that global warming was, indeed, a reality. While the panel, headed by Chairman John Wallace, a professor of atmospheric sciences at the University of Washington, stated that it

remained unclear whether human activities have contributed to the earth's increasing temperatures, it was apparent that global warming exists.

In 2001, following a request for further study by the incoming Bush administration in the [United States](#), the National Academy of Sciences again confirmed that global warming had been in existence for the last 20 years. The study also projected an increase in temperature between 2.5 degrees and 10.4 degrees Fahrenheit by the year 2100. Furthermore, the study found the leading cause of global warming to be emissions of carbon dioxide from the burning of fossil fuels, and it noted that greenhouse gas accumulations in the earth's atmosphere was a result of human activities.

Within the scientific community, the controversy regarding has centered on the difference between surface air and upper air temperatures. Information collected since 1979 suggests that while the earth's surface temperature has increased by about a degree in the past century, the atmospheric temperature five miles above the earth's surface has indicated very little increase. Nevertheless, the panel stated that this discrepancy in temperature between surface and upper air does not invalidate the conclusion that global warming is taking place. Further, the panel noted that natural events, such as volcanic eruptions, can decrease the temperature in the upper atmosphere.

The major consequences of global warming potentially include the melting of the polar ice caps, which, in turn, contribute to the rise in sea levels. Many islands across the globe have already experienced a measurable loss of land as a result. Because global warming may increase the rate of evaporation, increased precipitation, in the form of stronger and more frequent storm systems, is another potential outcome. Other consequences of global warming may include the introduction and proliferation of new infectious diseases, loss of arable land (referred to as "desertification"), destructive changes to existing ecosystems, loss of biodiversity and the isolation of species, and concomitant adverse changes in the quality of human life.

International Policy Development in Regard to Global Warming:

Regardless of what the precise nature of the relationship between greenhouse gas emissions and global warming may be, it seems that there is some degree of a connection between the phenomena. Any substantial reductions in greenhouse gas emissions and global warming trends will likely involve systematic changes in industrial operations, the use of advanced energy sources and technologies, as well as global cooperation in implementing and regulating these transformations.

In this regard, the United Nations Framework Convention on Climate Change (UNFCCC) stipulated the following objectives:

1. To stabilize "greenhouse gas" concentrations within the atmosphere, in such a manner that would preclude hazardous anthropogenic intervention into the existing biosphere and ecosystems of the world. This stabilization process would facilitate the natural adaptation of ecosystems to

changes in climate.

2. To ensure and enable sustainable development and food production on a global scale.

*** See section on "International Environmental Agreements and Associations" for information related to international policies related to limiting greenhouse gases and controlling climate change emanating from historic summits at Kyoto, Copenhagen, Doha, and Paris. ***

2. Air Pollution

Long before global warming reared its head as a significant issue, those concerned about the environment and public health noted the deleterious effects of human-initiated combustion upon the atmosphere. Killer smogs from coal burning triggered acute health emergencies in London and other places. At a lower level of intensity motor vehicle, power plant, and industrial emissions impaired long-range visibility and probably had some chronic adverse consequences on the respiratory systems of persons breathing such air.

In time, scientists began associating the sulfur dioxide and nitrogen oxides released from coal burning with significant acid deposition in the atmosphere, eventually falling as "acid rain." This phenomenon has severely degraded forestlands, especially in Europe and a few parts of the [United States](#). It has also impaired some aquatic ecosystems and eaten away the surface of some human artifacts, such as marble monuments. Scrubber technology and conversion to cleaner fuels have enabled the level of industrial production to remain at least constant while significantly reducing acid deposition. Technologies aimed at cleaning the air and curtailing acid rain, soot, and smog may, nonetheless, boomerang as the perils of global warming become increasingly serious. In brief, these particulates act as sort of a sun shade -- comparable to the effect of volcanic eruptions on the upper atmosphere whereby periods of active volcanism correlate with temporarily cooler weather conditions. Thus, while the carbon dioxide releases that are an inevitable byproduct of combustion continue, by scrubbing the atmosphere of pollutants, an industrial society opens itself to greater insolation (penetration of the sun's rays and consequent heating), and consequently, it is likely to experience a correspondingly greater rise in ambient temperatures.

The health benefits of removing the sources of acid rain and smog are indisputable, and no one would recommend a return to previous conditions. Nevertheless, the problematic climatic effects of continually increasing emissions of carbon dioxide and other greenhouse gases pose a major global environmental challenge, not as yet addressed adequately.

3. Ozone Depletion

The stratospheric ozone layer functions to prevent ultraviolet radiation from reaching the earth. Normally, stratospheric ozone is systematically disintegrated and regenerated through natural photochemical processes. The stratospheric ozone layer, however, has been depleted unnaturally as a result of anthropogenic (man-made) chemicals, most especially chlorine and bromide compounds such as chlorofluorocarbons (CFCs), halons, and various industrial chemicals in the form of solvents, refrigerants, foaming agents, aerosol propellants, fire retardants, and fumigants. Ozone depletion is of concern because it permits a greater degree of ultraviolet-B radiation to reach the earth, which then increases the incidences of cancerous malignancies, cataracts, and human immune deficiencies. In addition, even in small doses, ozone depletion affects the ecosystem by disturbing food chains, agriculture, fisheries and other forms of biological diversity.

Transnational policies enacted to respond to the dangers of ozone depletion include the 1985 Vienna Convention on the Protection of the Ozone Layer and the 1987 Montreal Protocol on Substances that Deplete the Ozone Layer. The Montreal Protocol was subsequently amended in London in 1990, Copenhagen in 1992 and Vienna in 1995. By 1996, 155 countries had ratified the Montreal Protocol, which sets out a time schedule for the reduction (and eventual elimination) of ozone depleting substances (OPS), and bans exports and imports of ODS from and to non-participant countries.

In general, the Protocol stipulates that developed countries must eliminate halon consumption by 1994 and CFC consumption by 1996, while developing countries must eliminate these substances by 2010. Consumption of methyl bromide, which is used as a fumigant, was to be frozen at the 1995 in developed countries, and fully eliminated in 2010, while developing countries are to freeze consumption by 2002, based on average 1995-1998 consumption levels. Methyl chloroform is to be phased out by 2005. Under the Montreal Protocol, most ODS will be completely eliminated from use by 2010.

4. Land Degradation

In recent decades, land degradation in more arid regions of the world has become a serious concern. The problem, manifest as both "desertification" and "devegetation," is caused primarily by climate variability and human activities, such as "deforestation," excessive cultivation, overgrazing, and other forms of land resource exploitation. It is also exacerbated by inadequate irrigation practices. Although the effects of droughts on drylands have been temporary in the past, today, the productivity and sustainability of these lands have been severely compromised for the long term. Indeed, in every region of the world, land degradation has become an acute issue.

Desertification and Devegetation:

"Desertification" is a process of land degradation causing the soil to deteriorate, thus losing its nutrients and fertility, and eventually resulting in the loss of vegetation, known as "devegetation." As aforementioned, "desertification" and "devegetation" are caused by human activities, yet human beings are also the greatest casualties. Because these forms of land degradation affect the ability of the soil to produce crops, they concomitantly contribute to poverty. As population increases and demographic concentrations shift, the extent of land subject to stresses by those seeking to wrest subsistence from it has inexorably risen.

In response, the United Nations has formed the Convention to Combat Desertification-aimed at implementing programs to address the underlying causes of desertification, as well as measures to prevent and minimize its effects. Of particular significance is the formulation of policies on transboundary resources, such as areas around lakes and rivers. At a broader level, the Convention has established a Conference of Parties (COP), which includes all ratifying governments, for directing and advancing international action.

To ensure more efficacious use of funding, the Convention intends to reconfigure international aid to utilize a consultative and coordinated approach in the disbursement and expenditure of donor funds. In this way, local communities that are affected by desertification will be active participants in the solution-generation process. In-depth community education projects are envisioned as part of this new international aid program, and private donor financing is encouraged. Meanwhile, as new technologies are developed to deal with the problem of desertification, they need to be distributed for application across the world. Hence, the Convention calls for international cooperation in scientific research in this regard.

Desertification is a problem of sustainable development. It is directly connected to human challenges such as poverty, social and economic well-being and environmental protection as well. Broader environmental issues, such as climate change, biological diversity, and freshwater supplies, are indirectly related, so any effort to resolve this environmental challenge must entail coordinated research efforts and joint action.

Deforestation:

Deforestation is not a recent phenomenon. For centuries, human beings have cut down trees to clear space for land cultivation, or in order to use the wood for fuel. Over the last 200 years, and most especially after World War II, deforestation increased because the logging industry became a globally profitable endeavor, and so the clearing of forested areas was accelerated for the purposes of industrial development. In the long term, this intensified level of deforestation is considered problematic because the forest is unable to regenerate itself quickly. The deforestation that has

occurred in tropical rainforests is seen as an especially serious concern, due to the perceived adverse effects of this process upon the entire global ecosystem.

The most immediate consequence of deforestation is soil degradation. Soil, which is necessary for the growth of vegetation, can be a fragile and vital property. Organically, an extensive evolution process must take place before soil can produce vegetation, yet at the same time, the effects of natural elements, such as wind and rain, can easily and quickly degrade this resource. This phenomenon is known as soil erosion. In addition, natural elements like wind and rain reduce the amount of fertile soil on the ground, making soil scarcity a genuine problem. When fertile topsoil that already exists is removed from the landscape in the process of deforestation, soil scarcity is further exacerbated. Equally significant is the fact that once land has been cleared so that the topsoil can be cultivated for crop production, not only are the nutrient reserves in the soil depleted, thus producing crops of inferior quality, but the soil structure itself becomes stressed and deteriorates further.

Another direct result of deforestation is flooding. When forests are cleared, removing the cover of vegetation, and rainfall occurs, the flow of water increases across the surface of land. When extensive water runoff takes place, the frequency and intensity of flooding increases. Other adverse effects of deforestation include the loss of wildlife and biodiversity within the ecosystem that supports such life forms.

At a broader level, tropical rainforests play a vital role in maintaining the global environmental system. Specifically, destruction of tropical rainforests affects the carbon dioxide cycle. When forests are destroyed by burning (or rotting), carbon dioxide is released into the air, thus contributing to an intensified "greenhouse effect." The increase in greenhouse gas emissions like carbon dioxide is a major contributor to global warming, according to many environmental scientists. Indeed, trees themselves absorb carbon dioxide in the process of photosynthesis, so their loss also reduces the absorption of greenhouse gases.

Tropical rainforest destruction also adversely affects the nitrogen cycle. Nitrogen is a key nutrient for both plants and animals. Plants derive nitrogen from soil, while animals obtain it via nitrogen-enriched vegetation. This element is essential for the formation of amino acids, and thereby for proteins and biochemicals that all living things need for metabolism and growth. In the nitrogen cycle, vegetation acquires these essential proteins and biochemicals, and then cyclically returns them to the atmosphere and global ecosystem. Accordingly, when tropical rainforest ecosystems are compromised, not only is vegetation removed; the atmosphere is also affected and climates are altered. At a more immediate level, the biodiversity within tropical rainforests, including wildlife and insect species and a wealth of plant varieties, is depleted. Loss of rare plants is of particular concern because certain species as yet unknown and unused could likely yield many practical benefits, for instance as medicines.

As a result of the many challenges associated with deforestation, many environmental groups and agencies have argued for government policies on the sustainable development of forests by governments across the globe. While many countries have instituted national policies and programs aimed at reducing deforestation, and substantial research has been advanced in regard to sustainable and regenerative forestry development, there has been very little progress on an international level. Generally speaking, most tropical rainforests are located in developing and less developed countries, where economic growth is often dependent upon the exploitation of tropical rainforests. Timber resources as well as wildlife hunting tend to be particularly lucrative arenas.

In places such as the Amazon, where deforestation takes place for the construction of energy plants aimed at industrialization and economic development, there is an exacerbated effect on the environment. After forests are cleared in order to construct such projects, massive flooding usually ensues. The remaining trees then rot and decay in the wake of the flooding. As the trees deteriorate, their biochemical makeup becomes more acidic, producing poisonous substances such as hydrogen sulphide and methane gases. Acidified water subsequently corrodes the mechanical equipment and operations of the plants, which are already clogged by rotting wood after the floodwaters rise.

Deforestation generally arises from an economically plausible short-term motivation, but nonetheless poses a serious global concern because the effects go beyond national boundaries. The United Nations has established the World Commission on Forest and Sustainable Development. This body's task is to determine the optimal means of dealing with the issue of deforestation, without unduly affecting normal economic development, while emphasizing the global significance of protecting tropical forest ecosystems.

5. Water Resources

For all terrestrial fauna, including humans, water is the most immediate necessity to sustain life. As the population has increased and altered an ever-greater portion of the landscape from its natural condition, demand on water resources has intensified, especially with the development of industrialization and large-scale irrigation. The supply of freshwater is inherently limited, and moreover distributed unevenly across the earth's landmasses. Moreover, not just demand for freshwater but activities certain to degrade it are becoming more pervasive. By contrast, the oceans form a sort of "last wilderness," still little explored and in large part not seriously affected by human activity. However, coastal environments - the biologically richest part of the marine ecosystem-are experiencing major depletion due to human encroachment and over-exploitation.

Freshwater:

In various regions, for instance the Colorado River in the western [United States](#), current withdrawals of river water for irrigation, domestic, and industrial use consume the entire streamflow so that almost no water flows into the sea at the river's mouth. Yet development is ongoing in many such places, implying continually rising demand for water. In some areas reliant on groundwater, aquifers are being depleted at a markedly faster rate than they are being replenished. An example is the San Joaquin Valley in California, where decades of high water withdrawals for agriculture have caused land subsidence of ten meters or more in some spots. Naturally, the uncertainty of future water supplies is particularly acute in arid and semi-arid regions. Speculation that the phenomenon of global warming will alter geographic and seasonal rainfall patterns adds further uncertainty.

Water conservation measures have great potential to alleviate supply shortages. Some city water systems are so old and beset with leaking pipes that they lose as much water as they meter. Broad-scale irrigation could be replaced by drip-type irrigation, actually enhancing the sustainability of agriculture. In many areas where heavy irrigation has been used for decades, the result is deposition of salts and other chemicals in the soil such that the land becomes unproductive for farming and must be abandoned.

Farming is a major source of water pollution. Whereas restrictions on industrial effluents and other "point sources" are relatively easy to implement, comparable measures to reform hydraulic practices at farms and other "nonpoint sources" pose a significantly knottier challenge. Farm-caused water pollution takes the following main forms:

- Nitrate pollution found in wells in intensive farming areas as a consequence of heavy fertilizer use is a threat to human health. The most serious danger is to infants, who by ingesting high-nitrate water can contract methemoglobinemia, sometimes called "blue baby syndrome," a potentially fatal condition.
- Fertilizer runoff into rivers and lakes imparts unwanted nutrients that cause algae growth and eventual loss of oxygen in the body of water, degrading its ability to support fish and other desirable aquatic life.
- Toxic agricultural chemicals - insecticides, herbicides, and fungicides - are detectable in some aquifers and waterways.

In general, it is much easier to get a pollutant into water than to retrieve it out. Gasoline additives, dry cleaning chemicals, other industrial toxins, and in a few areas radionuclides have all been found in water sources intended for human use. The complexity and long time scale of subterranean hydrological movements essentially assures that pollutants already deposited in aquifers will continue to turn up for decades to come. Sophisticated water treatment processes are available, albeit expensive, to reclaim degraded water and render it fit for human consumption. Yet

source protection is unquestionably a more desirable alternative.

In much of the developing world, and even some low-income rural enclaves of the developed world, the population lacks ready access to safe water. Surface water and shallow groundwater supplies are susceptible to contamination from untreated wastewater and failing septic tanks, as well as chemical hazards. The occurrence of waterborne disease is almost certainly greatly underreported.

Marine Resources:

Coastal areas have always been desirable places for human habitation, and population pressure on them continues to increase. Many types of water degradation that affect lakes and rivers also affect coastal zones: industrial effluents, untreated or partially treated sewage, nutrient load from agriculture figure prominently in both cases. Prospects for more extreme storms as a result of global warming, as well as the pervasiveness of poorly planned development in many coastal areas, forebode that catastrophic hurricanes and landslides may increase in frequency in the future. Ongoing rise in sea levels will force remedial measures and in some cases abandonment of currently valuable coastal property.

Fisheries over much of the globe have been overharvested, and immediate conservation measures are required to preserve stocks of many species. Many governments subsidized factory-scale fishing fleets in the 1970s and 1980s, and the resultant catch increase evidently surpassed a sustainable level. It is uncertain how much of the current decline in fish stocks stems from overharvesting and how much from environmental pollution. The deep ocean remains relatively unaffected by human activity, but continental shelves near coastlines are frequently seriously polluted, and these close-to-shore areas are the major biological nurseries for food fish and the smaller organisms they feed on.

6. Environmental Toxins

Toxic chemical pollution exploded on the public consciousness with disclosure of spectacularly polluted industrial areas such as Love Canal near Buffalo, New York. There is no question that pollutants such as organophosphates or radionuclides can be highly deleterious to health, but evidence to date suggests that seriously affected areas are a localized rather than universal problem.

While some explore the possibilities for a lifestyle that fully eschews use of modern industrial chemicals, the most prevalent remediative approach is to focus on more judicious use. The most efficient chemical plants are now able to contain nearly all toxic byproducts of their production processes within the premises, minimizing the release of such substances into the environment.

Techniques such as Integrated Pest Management (IPM) dictate limited rather than broadcast use of pesticides: application only when needed using the safest available chemical, supplemented as much as possible with nontoxic controls.

While heightened public awareness and growing technical sophistication suggest a hopeful outlook on limiting the damage from manmade environmental toxins, one must grant that previous incidents of their misuse and mishandling have already caused environmental damage that will have to be dealt with for many years to come. In the case of the most hazardous radioactive substances, the time scale for successful remediation actually extends beyond that of the recorded history of civilization. Moreover, in this era of high population density and rapid economic growth, quotidian activities such as the transport of chemicals will occasionally, seemingly inevitably result in accidents with adverse environmental consequences.

7. "Islandization" and Biodiversity

With increased awareness regarding the adverse effects of unregulated hunting and habitat depletion upon wildlife species and other aspects of biodiversity, large-scale efforts across the globe have been initiated to reduce and even reverse this trend.

In every region of the world, many species of wildlife and areas of biodiversity have been saved from extinction. Nationally, many countries have adopted policies aimed at preservation and conservation of species, and one of the most tangible measures has been the proliferation of protected habitats. Such habitats exist in the form of wildlife reserves, marine life reserves, and other such areas where biodiversity can be protected from external encroachment and exploitation.

Despite these advances in wildlife and biodiversity protection, further and perhaps more intractable challenges linger. Designated reserves, while intended to prevent further species decline, exist as closed territories, fragmented from other such enclaves and disconnected from the larger ecosystem. This environmental scenario is referred to as "islandization." Habitat reserves often serve as oversized zoos or game farms, with landscapes and wildlife that have effectively been "tamed" to suit. Meanwhile, the larger surrounding ecosystem continues to be seriously degraded and transformed, while within the islandized habitat, species that are the focus of conservation efforts may not have sufficient range and may not be able to maintain healthy genetic variability.

As a consequence, many conservationists and preservationists have demanded that substantially larger portions of land be withheld as habitat reserves, and a network of biological corridors to connect continental reserves be established. While such efforts to combat islandization have considerable support in the [United States](#), how precisely such a program would be instituted, especially across national boundaries, remains a matter of debate. International conservationists and preservationists say without a network of reserves a massive loss of biodiversity will result.

The concept of islandization illustrates why conservation and preservation of wildlife and biodiversity must consider and adopt new, broader strategies. In the past, conservation and preservation efforts have been aimed at specific species, such as the spotted owl and grizzly bear in North America, the Bengal tiger in Southeast Asia, the panda in [China](#), elephants in Africa. Instead, the new approach is to simultaneously protect many and varied species that inhabit the same ecosystem. This method, referred to as "bio-regional conservation," may more efficaciously generate longer-term and more far-reaching results precisely because it is aimed at preserving entire ecosystems, and all the living things within.

More About Biodiversity Issues:

This section is directly taken from the United Nations Environmental Program: "[Biodiversity Assessment](#)"

The Global Biodiversity Assessment, completed by 1500 scientists under the auspices of United Nations Environmental Program in 1995, updated what is known (or unknown) about global biological diversity at the ecosystem, species and genetic levels. The assessment was uncertain of the total number of species on Earth within an order of magnitude. Of its working figure of 13 million species, only 13 percent are scientifically described. Ecological community diversity is also poorly known, as is its relationship to biological diversity, and genetic diversity has been studied for only a small number of species. The effects of human activities on biodiversity have increased so greatly that the rate of species extinctions is rising to hundreds or thousands of times the background level. These losses are driven by increasing demands on species and their habitats, and by the failure of current market systems to value biodiversity adequately. The Assessment calls for urgent action to reverse these trends.

There has been a new recognition of the importance of protecting marine and aquatic biodiversity. The first quantitative estimates of species losses due to growing coral reef destruction predict that almost 200,000 species, or one in five presently contributing to coral reef biodiversity, could die out in the next 40 years if human pressures on reefs continue to increase.

Since Rio, many countries have improved their understanding of the status and importance of their biodiversity, particularly through biodiversity country studies such as those prepared under the auspices of UNEP/GEF. The [United Kingdom](#) identified 1250 species needing monitoring, of which 400 require action plans to ensure their survival. Protective measures for biodiversity, such as legislation to protect species, can prove effective. In the USA, almost 40 percent of the plants and animals protected under the Endangered Species Act are now stable or improving as a direct result of recovery efforts. Some African countries have joined efforts to protect threatened species through the 1994 Lusaka Agreement, and more highly migratory species are being protected by

specialized cooperative agreements among range states under the Bonn Agreement.

There is an emerging realization that a major part of conservation of biological diversity must take place outside of protected areas and involve local communities. The extensive agricultural areas occupied by small farmers contain much biodiversity that is important for sustainable food production. Indigenous agricultural practices have been and continue to be important elements in the maintenance of biodiversity, but these are being displaced and lost. There is a new focus on the interrelationship between agrodiversity conservation and sustainable use and development practices in smallholder agriculture, with emphasis on use of farmers' knowledge and skills as a source of information for sustainable farming.

Perhaps even more important than the loss of biodiversity is the transformation of global biogeochemical cycles, the reduction in the total world biomass, and the decrease in the biological productivity of the planet. While quantitative measurements are not available, the eventual economic and social consequences may be so significant that the issue requires further attention.

International Environmental Agreements and Associations

International Policy Development in Regard to Global Warming:

Introduction

Regardless of what the precise nature of the relationship between greenhouse gas emissions and global warming may be, it seems that there is some degree of a connection between the phenomena. Any substantial reductions in greenhouse gas emissions and global warming trends will likely involve systematic changes in industrial operations, the use of advanced energy sources and technologies, as well as global cooperation in implementing and regulating these transformations.

In this regard, the United Nations Framework Convention on Climate Change (UNFCCC) stipulated the following objectives:

1. To stabilize "greenhouse gas" concentrations within the atmosphere, in such a manner that would preclude hazardous anthropogenic intervention into the existing biosphere and ecosystems of the world. This stabilization process would facilitate the natural adaptation of ecosystems to changes in climate.
2. To ensure and enable sustainable development and food production on a global scale.

Following are two discussions regarding international policies on the environment, followed by listings of international accords.

Special Entry: The Kyoto Protocol

The UNFCCC was adopted at the Rio Earth Summit in 1992, and entered into force in 1994. Over 175 parties were official participants.

Meanwhile, however, many of the larger, more industrialized nations failed to reach the emissions' reduction targets, and many UNFCCC members agreed that the voluntary approach to reducing emissions had not been successful. As such, UNFCCC members reached a consensus that legally binding limits were necessitated, and agreed to discuss such a legal paradigm at a meeting in Kyoto, [Japan](#) in 1997. At that meeting, the UNFCCC forged the Kyoto Protocol. This concord is the first legally binding international agreement that places limits on emissions from industrialized countries. The major greenhouse gas emissions addressed in the Kyoto Protocol include carbon dioxide, nitrous oxide, hydrofluorocarbons, perfluorocarbons, sulfur hexafluoride, and methane.

The provisions of the Kyoto Protocol stipulate that economically advanced nations must reduce their combined emissions of greenhouse gases, by approximately five percent from their 1990

levels, before the 2008-2010 deadline. Countries with the highest carbon dioxide emissions, such as the [United States](#) (U.S.), many of the European Union (EU) countries, and [Japan](#), are to reduce emissions by a scale of 6 to 8 percent. All economically advanced nations must show "demonstrable progress" by 2005. In contrast, no binding limits or timetable have been set on developing countries. Presumably, this distinction is due to the fact that most developing countries - - with the obvious exceptions of [India](#) and [China](#) -- simply do not emit as many greenhouse gases as do more industrially advanced countries. Meanwhile, these countries are entrenched in the process of economic development.

Regardless of the aforementioned reasoning, there has been strong opposition against the asymmetrical treatment assigned to emissions limits among developed and developing countries. Although this distinction might be regarded as unfair in principle, associations such as the Alliance of Small Island States have been vocal in expressing how global warming -- a result of greenhouse gas emissions - has contributed to the rise in sea level, and thus deleteriously affected their very existence as island nation states. For this reason, some parties have suggested that economically advanced nations, upon returning to their 1990 levels, should be required to further reduce their greenhouse gas emissions by a deadline of 2005. In response, interested parties have observed that even if such reductions were undertaken by economically advanced nations, they would not be enough to completely control global warming. Indeed, a reduction in the rate of fossil fuel usage by developing nations would also be necessary to have substantial ameliorative effect on global warming. Indeed, a reduction in the rate of fossil fuel usage by developing nations would also be necessary to have substantial ameliorative effect on global warming.

As such, the Protocol established a "Clean Development Mechanism" which permits developed countries to invest in projects aimed at reducing emissions within developing countries in return for credit for the reductions. Ostensibly, the objective of this mechanism is to curtail emissions in developing countries without unduly penalizing them for their economic development. Under this model, the countries with more potential emissions credits could sell them to other signatories of the Kyoto Protocol, whose emissions are forecast to significantly rise in the next few years. Should this trading of emissions credits take place, it is estimated that the Kyoto Protocol's emissions targets could still be met.

In 1999, the International Energy Outlook projected that Eastern Europe, the former Soviet Union and Newly Independent States, as well as parts of Asia, are all expected to show a marked decrease in their level of energy-related carbon emissions in 2010. Nations with the highest emissions, specifically, the U.S., the EU and [Japan](#), are anticipated to reduce their emissions by up to 8 percent by 2012. By 2000, however, the emissions targets were not on schedule for achievement. Indeed, the U.S. Department of Energy estimates forecast that by 2010, there will be a 34 percent increase in carbon emissions from the 1990 levels, in the absence of major shifts in policy, economic growth, energy prices, and consumer trends. Despite this assessment in the U.S., international support for the Kyoto Protocol remained strong, especially among European countries

and island states, who view the pact as one step in the direction away from reliance on fossil fuels and other sources of greenhouse gases.

In 2001, U.S. President, George W. Bush, rejected his country's participation in the Kyoto Protocol, saying that the costs imposed on the global economic system, and especially, on the US, overshadowed the benefits of the Protocol. He also cited the unfair burden on developed nations to reduce emissions, as another primary reasons for withdrawal from the international pact, as well as insufficient evidence regarding the science of global warming. Faced with impassioned international disapproval for his position, the U.S. president stated that his administration remained interested in dealing with the matter of global warming, but would endorse alternative measures to combat the problem, such as voluntary initiatives limiting emissions. Critics of Bush's position, however, have noted that it was the failure of voluntary initiatives to reduce emissions following the Rio Summit that led to the establishment of the Kyoto Protocol in the first place.

In the wake of the Bush administration's decision, many participant countries resigned themselves to the reality that the goals of the Kyoto Protocol might not be achieved without U.S. involvement. Nevertheless, in Bonn, [Germany](#), in July 2001, the remaining participant countries struck a political compromise on some of the key issues and sticking points, and planned to move forward with the Protocol, irrespective of the absence of the U.S. The key compromise points included the provision for countries to offset their targets with carbon sinks (these are areas of forest and farmland which can absorb carbon through the process of photosynthesis). Another compromise point within the broader Bonn Agreement was the reduction of emissions cuts of six gases from over 5 percent to a more achievable 2 percent. A third key change was the provision of funding for less wealthy countries to adopt more progressive technologies.

In late October and early November 2001, the UNFCCC's 7th Conference of the Parties met in Marrakesh, [Morocco](#), to finalize the measures needed to make the Kyoto Protocol operational. Although the UNFCCC projected that ratification of the Protocol would make it legally binding within a year, many critics noted that the process had fallen short of implementing significant changes in policy that would be necessary to actually stop or even slow climate change. They also maintained that the absence of U.S. participation effectively rendered the Protocol into being a political exercise without any substance, either in terms of transnational policy or in terms of environmental concerns.

The adoption of the compromises ensconced within the Bonn Agreement had been intended to make the provisions of the Kyoto Protocol more palatable to the U.S. In this regard, it failed to achieve its objective as the Bush administration continued to eschew participation in the international accord. Still, however, the Bonn Agreement did manage to render a number of other positive outcomes. Specifically, in 2002, key countries, such as [Russia](#), [Japan](#) and [Canada](#) agreed to ratify the protocol, bringing the number of signatories to 178. The decision by key countries to

ratify the protocol was regarded as "the kiss of life" by observers.

By 2005, on the eve of a climate change conference in London, British Prime Minister Tony Blair was hoping to deal with the problems of climate change beyond the provisions set forth in the Kyoto Protocol. Acknowledging that the Kyoto Protocol could not work in its current form, Blair wanted to open the discussion for a new climate change plan.

Blair said that although most of the world had signed on to Kyoto, the protocol could not meet any of its practical goals of cutting greenhouse gas emissions without the participation of the United States, the world's largest polluter. He also noted that any new agreement would have to include India and China -- significant producers of greenhouse gas emissions, but exempt from Kyoto because they have been classified as developing countries. Still, he said that progress on dealing with climate change had been stymied by "a reluctance to face up to reality and the practical action needed to tackle problem."

Blair also touted the "huge opportunities" in technology and pointed toward the possibilities offered by wind, solar and nuclear power, along with fuel cell technology, eco-friendly biofuels, and carbon capture and storage which could generate low carbon power. Blair also asserted that his government was committed to achieving its domestic goal of reducing carbon dioxide emissions by 20 percent by 2010.

In the United States, President George W. Bush has said that global warming remained a debatable issue and despite conclusions reached by his own Environmental Protection Agency, he has not agreed with the conclusion that global warming and climate change are linked with human activities. Bush has also refused to ratify Kyoto on the basis of its economic costs.

Australia, an ally of the United States, has taken a similarly dim view of the Kyoto Protocol. Ahead of the November 2005 climate change meeting in Canada in which new goals for the protocol were to be discussed, Australia's Environment Minister, Ian Campbell, said that negotiating new greenhouse gas emission levels for the Kyoto Protocol would be a waste of time. Campbell said, "There is a consensus that the caps, targets and timetables approach is flawed. If we spend the next five years arguing about that, we'll be fiddling and negotiating while Rome burns." Campbell, like the Bush administration, has also advocated a system of voluntary action in which industry takes up new technologies rather than as a result of compelling the reduction of emissions. But the Australian Conservation Foundation (ACF) has called on its government to ratify the Kyoto Protocol, to establish a system of emissions trading, and to set binding limits on emissions. Interestingly, although it did not sign on to Kyoto, Australia was expected to meet its emissions target by 2012 (an 8 percent increase in 1990 levels in keeping with the country's reliance on coal). But this success has nothing to do with new technologies and is due to state-based regulations on land clearing.

Note: The Kyoto Protocol calls for developed nations to cut greenhouse emissions by 5.2 percent

of 1990 levels by 2012.

Special Entry: Climate Change Summit in Copenhagen (2009) --

In December 2009, the United Nations Climate Change Summit opened in the Danish capital of Copenhagen. The summit was scheduled to last from Dec. 7-18, 2009. Delegates from more than 190 countries were in attendance, and approximately 100 world leaders, including British Prime Minister Gordon Brown and [United States](#) President Barack Obama, were expected to participate. At issue was the matter of new reductions targets on greenhouse gas emissions by 2020.

Despite earlier fears that little concurrence would come from the conference, effectively pushing significant actions forward to a 2010 conference in [Mexico](#) City, negotiators were now reporting that the talks were productive and several key countries, such as [South Africa](#), had pledged to reduce greenhouse gas emissions. The two main issues that could still lead to cleavages were questions of agreement between the industrialized countries and the developing countries of the world, as well as the overall effectiveness of proposals in seriously addressing the perils of climate change.

On Dec. 9, 2009, four countries -- the [United Kingdom](#), [Australia](#), [Mexico](#) and [Norway](#) -- presented a document outlining ideas for raising and managing billions of dollars, which would be intended to help vulnerable countries dealing with the perils of climate change. Described as a "green fund," the concept could potentially help small island states at risk because of the rise in sea level. [Bangladesh](#) identified itself as a potential recipient of an assistance fund, noting that as a country plagued by devastating floods, it was particularly hard-hit by climate change. The "green fund" would fall under the rubric of the United Nations Framework Convention on Climate Change, for which developed countries have been committed to quantifying their emission reduction targets, and also to providing financial and technical support to developing countries.

The [United Kingdom](#), [Australia](#), [Mexico](#) and [Norway](#) also called for the creation of a new legal treaty that would replace the Kyoto Protocol. This new treaty, which could go into force in 2012, would focus largely on the reduction of greenhouse gas emissions by 2020. But [Australia](#) went even further in saying that the successor treaty to the Kyoto Protocol, should be one with provisions covering all countries. Such a move would be a departure from the structure of the Kyoto Protocol, which contained emissions targets for industrialized countries due to the prevailing view that developed countries had a particular historic responsibility to be accountable for climate change. More recently, it has become apparent that substantial reductions in greenhouse gas emissions demanded by scientists would only come to pass with the participation also of significant developing nation states, such as [China](#) and [India](#). Indeed, one of the most pressing critiques of the Kyoto Protocol was that it was a "paper tiger" that failed to address the impact of the actions of emerging economies like [China](#) and [India](#), with its focus on the developed economies.

Now, in 2009, [China](#) -- as the world's biggest greenhouse gas emitter -- was responding this dubious distinction by vocalizing its criticism of the current scenario and foregrounding its new commitments. Ahead of the Copenhagen summit, [China](#) had announced it would reduce the intensity of its carbon emissions per unit of its GDP in 2020 by 40 to 45 percent against 2005 levels. With that new commitment at hand, [China](#) was now accusing the [United States](#) and the European Union of shirking their own responsibilities by setting weak targets for greenhouse gas emissions cuts. Senior Chinese negotiator, Su Wei, characterized the goals of the world's second largest greenhouse gas emitter -- the [United States](#) -- as "not notable," and the European Union's target as "not enough." Su Wei also took issue with [Japan](#) for setting implausible preconditions.

On Dec. 11, 2009, [China](#) demanded that developed and wealthy countries in Copenhagen should help deliver a real agreement on climate change by delivering on their promises to reduce carbon emissions and provide financial support for developing countries to adapt to global warming. In so doing, China's Vice Foreign Minister He Yafei said his country was hoping that a "balanced outcome" would emerge from the discussions at the summit. Echoing the position of the Australian government, He Yafei spoke of a draft agreement as follows: "The final document we're going to adopt needs to be taking into account the needs and aspirations of all countries, particularly the most vulnerable ones."

China's Vice Foreign Minister emphasized the fact that climate change was "a matter of survival" for developing countries, and accordingly, such countries need wealthier and more developed countries to accentuate not only their pledges of emissions reduction targets, but also their financial commitments under the aforementioned United Nations Framework Convention on Climate Change. To that end, scientists and leaders of small island states in the Indian Ocean, the Pacific Ocean and the Caribbean Sea, have highlighted the existential threat posed by global warming and the concomitant rise in sea level.

China aside, attention was also on [India](#) -- another major player in the developing world and a country with an industrializing economy that was impacting the environment. At issue was the Indian government's decision to set a carbon intensity target, which would slow emissions growth by up to 25 percent by the 2020 deadline. This strong position was resisted by some elements in [India](#), who argued that their country should not be taking such a strong position when developed wealthy countries were yet to show accountability for their previous commitments to reduce greenhouse gas emissions. The matter grew so heated that the members of the opposition stormed out of the parliament in protest as Indian Environment Minister Jairam Ramesh defended the policy. But the political pressure at home in [India](#) was leaving the Indian delegation in Copenhagen in a state of chaos as well. In fact, India's top environmental negotiator refused to travel to Copenhagen in protest of the government's newly-announced stance.

China and [India](#) were joined by [Brazil](#) and [South Africa](#) in the crafting of a draft document calling for a new global climate treaty to be completed by June 2010. Of concern has been the realization

that there was insufficient time to find concurrence on a full legal treaty, which would leave countries only with a politically-binding text by the time the summit at Copenhagen closed. But Guyana's leader, President Bharrat Jagdeo, warned that the summit in [Denmark](#) would be classified as a failure unless a binding document was agreed upon instead of just political consensus. He urged his cohorts to act with purpose saying, "Never before have science, economics, geo-strategic self-interest and politics intersected in such a way on an issue that impacts everyone on the planet."

Likewise, [Tuvalu](#) demanded that legally binding agreements emerge from Copenhagen. Its proposal was supported by many of the vulnerable countries, from small island states and sub-Saharan Africa, all of whom warned of the catastrophic impact of climate change on their citizens. [Tuvalu](#) also called for more aggressive action, such as an amendment to the 1992 agreement, which would focus on sharp greenhouse gas emissions and the accepted rise in temperatures, due to the impact the rise in seas. The delegation from [Kiribati](#) joined the call by drawing attention to the fact that one village had to be abandoned due to waist-high water, and more such effects were likely to follow. Kiribati's Foreign Secretary, Tessie Lambourne, warned that the people of [Kiribati](#) could well be faced with no homeland in the future saying, "Nobody in this room would want to leave their homeland." But despite such impassioned pleas and irrespective of warnings from the Intergovernmental Panel on Climate Change that the rise in sea level from melting polar ice caps would deleteriously affect low-lying atolls such as such as [Tuvalu](#) and [Kiribati](#) in the Pacific, and the [Maldives](#) in the Indian Ocean, the oil-giant [Saudi Arabia](#) was able to block this move.

Meanwhile, within the developed countries, yet another power struggle was brewing. The European Union warned it would only agree to raise its target of 20 percent greenhouse gas emissions reductions to 30 percent if the [United States](#) demonstrated that it would do more to reduce its own emissions. It was unknown if such pressure would yield results. [United States](#) President Barack Obama offered a "provisional" 2020 target of 17 percent reductions, noting that he could not offer greater concessions at Copenhagen due to resistance within the [United States](#) Congress, which was already trying to pass a highly controversial "cap and trade" emissions legislation. However, should that emissions trading bill fail in the Senate, the [United States](#) Environment Protection Agency's declaration that greenhouse gases pose a danger to human health and the environment was expected to facilitate further regulations and limits on power plants and factories at the national level. These moves could potentially strengthen the Obama administration's offering at Copenhagen. As well, President Obama also signaled that he would be willing to consider the inclusion of international forestry credits.

Such moves indicated willingness by the Obama administration to play a more constructive role on the international environmental scene than its predecessor, the Bush administration. Indeed, ahead of his arrival at the Copenhagen summit, President Barack Obama's top environmental advisors promised to work on a substantial climate change agreement. To that end, [United States](#)

Environmental Protection Agency Administrator Lisa Jackson said at a press conference, "We are seeking robust engagement with all of our partners around the world." But would this pro-engagement assertion yield actual results?

By Dec. 12, 2009, details related to a draft document prepared by Michael Zammit Cutajar, the head of the Ad-hoc Working Group on Long-Term Cooperative Action, were released at the Copenhagen climate conference. Included in the document were calls for countries to make major reductions in carbon emissions over the course of the next decade. According to the Washington Post, industrialized countries were called on to make cuts of between 25 percent and 40 percent below 1990 levels -- reductions that were far more draconian than the [United States](#) was likely to accept. As discussed above, President Obama had offered a provisional reduction target of 17 percent. The wide gap between the released draft and the United States' actual stated position suggested there was much more negotiating in the offing if a binding agreement could be forged, despite the Obama administration's claims that it was seeking greater engagement on this issue.

In other developments, the aforementioned call for financial support of developing countries to deal with the perils of climate change was partly answered by the European Union on Dec. 11, 2009. The European bloc pledged an amount of 2.4 billion euros (US\$3.5 billion) annually from 2010 to 2012. Environment Minister Andreas Carlgren of [Sweden](#) -- the country that holds the rotating presidency of the European Union at the time of the summit -- put his weight behind the notion of a "legally binding deal." Meanwhile, Yvo de Boer, a top United Nations climate change official, focused less on the essence of the agreement and more on tangible action and effects saying, "Copenhagen will only be a success if it delivers significant and immediate action that begins the day the conference ends."

The division between developed and developing countries in Copenhagen reached new heights on Dec. 14, 2009, when some of the poor and less developed countries launched a boycott at the summit. The move, which was spurred by African countries but backed by [China](#) and [India](#), appeared to be geared toward redirecting attention and primary responsibility to the wealthier and more industrialized countries. The impasse was resolved after the wealthier and more industrialized countries offered assurances that they did not intend on shirking from their commitments to reducing greenhouse gases. As a result, the participating countries ceased the boycott.

Outside the actual summit, thousands of protestors had gathered to demand crucial global warming, leading to clashes between police and demonstrators elsewhere in the Danish capital city. There were reports of scattered violence across Copenhagen and more than 1,000 people were arrested.

Nevertheless, by the second week of the climate change summit, hopes of forging a strong deal were eroding as developed and developing nations remained deadlocked on sharing cuts in greenhouse gases, and particularly on the matters of financing and temperature goals. In a bid to

shore up support for a new climate change, [United States](#) President Barack Obama joined other world leaders in Copenhagen. On Dec. 14, 2009, there was a standoff brewing between the [United States](#) and [China](#). At issue was China's refusal to accept international monitoring of its expressed targets for reducing greenhouse gas emissions. The [United States](#) argued that China's opposition to verification could be a deal-breaker.

By the close of the summit, the difficult process eventually resulted in some consensus being cultivated. A draft text called for \$100 billion a year by 2020 to assist poor nations cope with climate change, while aiming to limit global warming to two degrees Celsius compared with pre-industrial levels. The deal also included specific targets for developed countries to reduce greenhouse gas emissions, and called for reductions by developing countries as a share of their economies. Also included in the agreement was a mechanism to verify compliance. The details of the agreement were supported by President Barack Obama, Chinese Premier Wen Jiabao, Indian Prime Minister Manmohan Singh and Brazilian President Luiz Inacio Lula da Silva.

This draft would stand as an interim agreement, with a legally-binding international pact unlikely to materialize until 2010. In this way, the summit in Copenhagen failed to achieve its central objective, which was to negotiate a successor to the Kyoto Protocol on greenhouse gas emissions.

Editor's Note

In the background of these developments was the growing global consciousness related to global warming and climate change. Indeed, as the Copenhagen summit was ongoing, it was clear there was enormous concurrence on the significance of the stakes with an editorial on the matter of climate change being published in 56 newspapers in 45 countries. That editorial warned that without global action, climate change would "ravage our planet." Meanwhile, a global survey taken by Globescan showed that concern over global warming had exponentially increased from 1998 -- when only 20 percent of respondents believed it to be a serious problem -- to 64 percent in 2009. Such survey data, however, was generated ahead of the accusations by climate change skeptics that some climate scientists may have overstated the case for global warming, based on emails derived in an illicit manner from a British University.

Special Entry: Climate change talks in Doha in [Qatar](#) extend life of Kyoto Protocol (2012)

December 2012 saw climate talks ensue in the Qatari city of Doha as representatives from countries across the world gathered to discuss the fate of the Kyoto Protocol, which seeks to minimize greenhouse gas emissions. The summit yielded results with decisions made (1) to extend the Kyoto Protocol until 2020, and (2) for wealthier countries to compensate poorer countries for the losses and damage incurred as a result of climate change.

In regards to the second matter, Malia Talakai of [Nauru](#), a leading negotiator for the Alliance of Small Island States, explained the necessity of the compensation package as follows: "We are trying to say that if you pollute you must help us."

This measure was being dubbed the "Loss and Damage" mechanism, and was being linked with [United States](#) President Barack Obama's request for \$60 billion from Congress to deal with the devastation caused by Hurricane Sandy months before. The sight of a hurricane bearing down on the northern Atlantic seaboard, along with the reality of the scope of reconstruction, appeared to have illustrated the economic costs of climate change -- not so much as a distant environmental issue -- but as a danger to the quotidian lives of people. Still, there was blame to be placed on the [United States](#) and European countries -- some of world's largest emitters -- for failing to do more to reduce emissions.

To that latter end, there was in fact little progress made on the central issue of reducing greenhouse gas emissions. Had those emissions been reduced, there would have been less of a need to financially deal with the devastation caused by climate change. One interpretation was that the global community was accepting the fact that industrialization was contributing to global warming, which had deleterious effects on the polar ice caps and concomitantly on the rise of sea level, with devastating effects for small island nations. Thus, wealthier countries were willing to pay around \$10 billion a year through 2020, effectively in "damages," to the poor countries that could be viewed as the "collateral damage" of industrial progress. But damages today could potentially be destruction tomorrow, leaving in place the existential challenges and burdens to be born by some of the world's smallest and least wealthy island countries.

Perhaps not surprisingly, the representative for the small island nation states at the Doha summit responded with ire, characterizing the lack of progress on reducing emissions as follows: "We see the package before us as deeply deficient in mitigation (carbon cuts) and finance. It's likely to lock us on the trajectory to a 3,4,5C rise in global temperatures, even though we agreed to keep the global average temperature rise of 1.5C to ensure survival of all islands. There is no new finance (for adapting to climate change and getting clean energy) -- only promises that something might materialize in the future. Those who are obstructive need to talk not about how their people will live, but whether our people will live."

Indeed, in most small island countries not just in the Pacific, but also the Caribbean and Indian Ocean, ecological concerns and the climate crisis have been dominant themes with dire life and death consequences looming in the background for their people. Small island nations in these region are already at risk from the rise of sea-level, tropical cyclones, floods. But their very livelihoods of fishing and subsistence farming were also at risk as a result of ecological and environmental changes. Increasingly high storm surges can wipe out entire villages and contaminate water supplies. Accordingly, the very existence of island nations, such as [Kiribati](#) and [Tuvalu](#), are at severe risk of being obliterated from the map. Yet even with the existential threat of being wiped

off the map in the offing, the international community has been either slow or restrictive in its efforts to deal with global warming, climate change, economic and ecological damage, as well as the emerging global challenge of environmental refugees.

A 2012 report from the United Nations Environment Program (UNEP) and the Pacific Regional Environment Program underlined the concerns of small island nations and their people as it concluded that the livelihoods of approximately 10 million people in Pacific island communities were increasingly vulnerable to climate change. In fact, low-lying islands in that region would likely confront losses of up to 18 percent of gross domestic product due to climate change, according to the report. The report covers 21 countries and territories, including [Fiji](#), [Kiribati](#), [Samoa](#) and [Tonga](#), and recommended environmental legislation intended to deal with the climate crisis facing the small island countries particularly. As noted by David Sheppard, the director general of the Pacific Regional Environment Program that co-sponsored this study: "The findings... emphasize the need more than ever to raise the bar through collective actions that address the region's environmental needs at all levels."

Regardless of the failures of the summit in [Qatar](#) (discussed above), the meeting did facilitate a process starting in 2015, which would bind both wealthy and poor countries together in the mission of forging a new binding treaty that would replace the Kyoto Protocol and tackle the central causes of climate change.

For more information on the threats faced in small island nations by climate change and the measures being undertaken to lobby for international action, please see the Alliance for Small Island States available online at the URL: <http://aosis.org/>

Special Report

COP 21 summit in Paris ends with historic agreement to tackle climate change; rare international consensus formed on environmental crisis facing the planet (2015) --

In mid-December 2015, the highly-anticipated United Nations climate conference of parties (COP) in Paris, [France](#), ended with a historic agreement. In fact, it would very likely be understood as the most significant international agreement signed by all the recognized countries of the world since the Cold War. Accordingly, the Paris Agreement was being distinguished as the first multilateral pact that would compel all countries across the world to cut its carbon emissions -- one of the major causes of increasing greenhouse gas emissions, which contribute to global warming, and its deleterious effects ranging from the dangerous rise in sea level to catastrophic climate change.

The accord, which was dubbed to be the "Paris Agreement," was the work of rigorous diplomacy

and fervent environmental advocacy, and it aimed to address the climate change crisis facing the planet. As many as 195 countries were represented in the negotiations that led to the landmark climate deal. Indeed, it was only after weeks of passionate debate that international concurrence was reached in addressing the environmental challenges confronting the world, with particular attention to moving beyond fossil fuels and reducing greenhouse gas emissions.

The success of the COP 21 summit in Paris and the emergence of the landmark Paris Agreement was, to some extent, attributed to the efforts of France's Foreign Minister Laurent Fabius who presided over the negotiations. The French foreign minister's experience and credentials as a seasoned diplomat and respected statesman paid dividends. He skillfully guided the delegates from almost 200 countries and interest groups along the negotiations process, with ostensibly productive results and a reasonably robust deal to show for it.

On Dec. 12, 2015, French Foreign Minister Fabius officially adopted the agreement, declaring: "I now invite the COP to adopt the decision entitled Paris Agreement outlined in the document. Looking out to the room I see that the reaction is positive, I see no objections. The Paris agreement is adopted." Once Foreign Minister Fabius' gavel was struck, symbolically inaugurating the Paris Agreement into force, the COP delegate rushed to their feet with loud and bouyant cheers as well as thunderous applause.

In general, the Paris Agreement was being hailed as a victory for enviromental activists and a triumph for international diplomats, while at the same time being understood as simply an initial -- and imperfect -- move in the direction of a sustainable future. China's chief negotiator, Xie Zhenhua, issued this message, saying that while the accord was not ideal, it should "not prevent us from marching historical steps forward."

United States President Barack Obama lauded the deal as both "ambitious" and "historic," and the work of strenuous multilateral negotiations as he declared, "Together, we've shown what's possible when the world stands as one." The [United States](#) leader acknowledged that the accord was not "perfect," but he reminded the critics that it was "the best chance to save the one planet we have."

Former [United States](#) Vice President Al Gore, one of the world's most well known environmental advocates, issued a lengthy statement on the accomplishments ensconced in the Paris Agreement. He highlighted the fact that the Paris Agreement was a first step towards a future with a reduced carbon footprint on Planet Earth as he said, "The components of this agreement -- including a strong review mechanism to enhance existing commitments and a long-term goal to eliminate global-warming pollution this century -- are essential to unlocking the necessary investments in our future. No agreement is perfect, and this one must be strengthened over time, but groups across every sector of society will now begin to reduce dangerous carbon pollution through the framework of this agreement."

The central provisions of the Paris Agreement included the following items:

- Greenhouse gas emissions should peak as quickly as possible, with a move towards balancing energy sources, and ultimately the decrease of greenhouse gases in the second half of this century
- Global temperature increase would be limited to 1.5 degrees Centigrade above pre-industrial levels and would be held "well below" the two degrees Centigrade threshold
- Progress on these goals would be reviewed every five years beginning in 2020 with new greenhouse gas reduction targets issued every five years
- \$100 billion would be expended each year in climate finance for developing countries to move forward with green technologies, with further climate financing to be advanced in the years beyond

It should be noted that there both legally binding and voluntary elements contained within the Paris Agreement. Specifically, the submission of an emissions reduction target and the regular review of that goal would be legally mandatory for all countries. Stated differently, there would be a system in place by which experts would be able to track the carbon-cutting progress of each country. At the same time, the specific targets to be set by countries would be determined at the discretion of the countries, and would not be binding. While there was some criticism over this non-binding element, the fact of the matter was that the imposition of emissions targets was believed to be a major factor in the failure of climate change talks in Copenhagen, [Denmark](#), in 2009.

In 2015, the talks faced challenges as several countries, such as [China](#) and [India](#), objected to conditions that would stymie economic and development. In order to avoid that kind of landmine, a system Intended Nationally Determined Contributions (INDCs) was developed and formed the basis of the accord. As such, the Paris Agreement would, in fact, facilitate economic growth and development, as well as technological progress, but with the goal of long-term ecological sustainability based on low carbon sources. In fact, the agreement heralded as "the beginning of the end of the fossil fuel era." As noted by Nick Mabey, the head of the climate diplomacy organization E3G, said, "Paris means governments will go further and faster to tackle climate change than ever before. The transition to a low carbon economy is now unstoppable, ensuring the end of the fossil fuel age."

A particular sticking point in the agreement was the \$100 billion earmarked for climate financing for developing countries to transition from traditional fossil fuels to green energy technologies and a low carbon future. In 2014, a report by the International Energy Agency indicated that the cost of that transition would actually be around \$44 trillion by the mid-century -- an amount that would render the \$100 billion being promised to be a drop in the proverbial bucket. However, the general expectation was that the Republican-controlled Senate in the [United States](#), which would have to ratify the deal in that country, was not interested in contributing significant funds for the cause of climate change.

A key strength of the Paris Agreement was the ubiquitous application of measures to all countries. Of note was the frequently utilized concept of "flexibility" with regard to the Paris Agreement. Specifically, the varying capacities of the various countries in meeting their obligations would be anticipated and accorded flexibility. This aspect presented something of a departure from the 1997 Kyoto Protocol, which drew a sharp distinction between developed and developing countries, and mandated a different set of obligations for those categories of countries. Thus, under Kyoto, [China](#) and [India](#) were not held to the same standards as the [United States](#) and European countries. In the Paris Agreement, there would be commitments from all countries across the globe.

Another notable strength of the Paris Agreement was the fact that the countries of the world were finally able to reach consensus on the vital necessity to limit global temperature increases to 1.5 degrees Centigrade. Ahead of the global consensus on the deal, and as controversy continued to surface over the targeted global temperature limits, the leaders of island countries were sounding the alarm about the melting of the Polar ice caps and the associated rise in sea level. Prime Minister Enele Sopoaga of [Tuvalu](#) issued this dismal reminder: "Tuvalu's future ... is already bleak and any further temperature increase will spell the total demise of [Tuvalu](#). No leader in this room carries such a level of worry and responsibility. Just imagine you are in my shoes, what would you do?" It was thus something of a victory for environmental advocates that the countries of the world could find consensus on the lower number -- 1.5 degrees rather than 2 degrees.

A significant weak point with regard to the Paris deal was a "loss and damage" provision, which anticipates that even with all the new undertakings intended to reduce greenhouse gas emissions and move to a low carbon future, there would nonetheless be unavoidable climate change consequences. Those consequences ranged from the loss of arable land for farmers as well as soil erosion and contamination of potable water by sea water, to the decimation of territory in coastal zones and on small islands, due to the rise in sea level, with entire small island countries being rendered entirely uninhabitable. The reality was that peoples' homes across the world would be destroyed along with their way of life.

With that latter catastrophic effect being a clear and present danger for small island countries, the Association of Small Island States (AOSIS) demanded that the developed world acknowledge its responsibility for this irreversible damage.. Despite the fact that greenhouse gas emissions and the ensuing plague of global warming was, indeed, the consequence of development in the West (the [United States](#) and Europe) and the large power house countries, such as [Russia](#), [China](#) and [India](#), there was no appetite by those countries to sign on to unlimited liability. Under the Paris Agreement, there was a call for research on insurance mechanisms that would address loss and damage issues, with recommendations to come in the future.

The call for research was being regarded as an evasion of sorts and constituted the weakest aspect of the Paris Agreement. Not surprisingly, a coalition of small island nations demanded a "Marshall

Plan" for the Pacific. Borrowing the term "Marshall Plan" from the post-World War II reconstruction effort, the coalition of Pacific island nation, which included [Kiribati](#), [Tuvalu](#), [Fiji](#), and the [Marshall Islands](#), called for an initiative that would include investment in renewable energy and shoreline protection, cultural preservation, economic assistance for economies in transition, and a plan for migration and resettlement for these countries as they confront the catastrophic effects of the melting of the Polar ice caps and the concomitant rise in sea level. The precise contours of the initiative remained unknown, unspecified, and a mere exercise in theory at the time of writing. Yet such an initiative would, at some point, have to be addressed, given the realities of climate change and the slow motion calamity unfolding each day for low-lying island nations across the world.

As noted by Vice President Greg Stone of Conservation International, who also functions as an adviser to the government of [Kiribati](#), "Imagine living in a place where you know it's going to go away someday, but you don't know what day that wave's going to come over and wash your home away." He added, "It's a disaster we know is going to happen." Meanwhile, the intervening years promised to be filled with hardship for small island nations, such as [Kiribati](#). Stone explained, "For every inch of sea-level rise, these islands lose 10 feet of their freshwater table to saltwater intrusion," Stone explained. "So it's not just about the day the water finally goes over the island; it's also about the day that there's just not enough water left and everyone has to move off the island." Presaging the future for island nations that could face submersion, Stone said, "If you look ahead 50 years, a country like [Kiribati](#) could become the first aqueous nation. possibility of migration. That is, they own this big patch of ocean, and they administer it from elsewhere."

Foreign Minister Minister Tony Debrum of the [Marshall Islands](#) emerged as the champion advocating on behalf of small island nation states and a loose coalition of concerned countries from the Pacific to the Caribbean, but with support from the [United States](#). He addressed the comprehensive concerns of small island nations regarding the weaknesses of the deal, while simultaneously making clear that the Paris Agreement signified hope for the countries most at risk. In a formal statement, Debrum declared: "We have made history today. Emissions targets are still way off track, but this agreement has the tools to ramp up ambition, and brings a spirit of hope that we can rise to this challenge. I can go back home to my people and say we now have a pathway to survival." Debrum highlighted the imperatives of Pacific island nations, saying, "Our High Ambition Coalition was the lightning rod we needed to lift our sights and expectations for a strong agreement here in Paris. We were joined by countries representing more than half the world. We said loud and clear that a bare-bones, minimalist agreement would not fly. We instead demanded an agreement to mark a turning point in history, and the beginning of our journey to the post-carbon era."

Debrum of the [Marshall Islands](#) espoused the quintessential synopsis of the accord and its effects for those most likely to be affected by climate change as he noted, "Climate change won't stop

overnight, and my country is not out of the firing line just yet, but today we all feel a little safer.”

Editor's Entry on [Environmental Policy](#):

The low-lying Pacific island nations of the world, including [Kiribati](#), [Tuvalu](#), the [Marshall Islands](#), [Fiji](#), among others, are vulnerable to the threats posed by global warming and climate change, derived from carbon emissions, and resulting in the rise in sea level. Other island nations in the Caribbean, as well as poor countries with coastal zones, were also at particular risk of suffering the deleterious effects of climate change.

Political policy in these countries are often connected to ecological issues, which have over time morphed into an existential crisis of sorts. Indeed, ecological concerns and the climate crisis have also been dominant themes with life and death consequences for the people of island nations in the Pacific. Indeed, the very livelihoods of fishing and subsistence farming remain at risk as a result of ecological and environmental changes. Yet even so, these countries are threatened by increasingly high storm surges, which could wipe out entire villages and contaminate water supplies. Moreover, because these are low lying island nations, the sustained rise in sea level can potentially lead to the terrain of these countries being uninhabitable at best, and submerged at worst. Stated in plain terms, these countries are at severe risk of being obliterated from the map and their plight illuminates the emerging global challenge of environmental refugees. In these manifold senses, climate change is the existential crisis of the contemporary era.

Since the time of the 1997 Kyoto Protocol, there have been efforts aimed at extending the life of that agreement, with an eye on minimizing greenhouse gas emissions, and thus minimizing the effects of climate change. Those endeavors have largely ended in failure, as exemplified by the unsuccessful Copenhagen talks in 2009 and the fruitless Doha talks in 2012 respectively. The success of the COP 21 talks in [France](#), with the adoption of the landmark Paris Agreement in 2015, was regarded as the first glimmer of hope. Not only did the Paris Agreement signify the triumph of international diplomacy and global consensus, but it also marked the start of the end of the fossil fuel era, with the path forward toward a low carbon future reliant on greener technologies. Most crucially, the Paris Agreement stood as the first significant response in recent times to the central challenge of climate change and its quotidian effects on the lives of real human beings across the world.

1. Major International Environmental Accords:

General Environmental Concerns

Convention on Environmental Impact Assessment in a Transboundary Context, Espoo, 1991.

Accords Regarding Atmosphere

Annex 16, vol. II (Environmental Protection: Aircraft Engine Emissions) to the 1044 Chicago Convention on International Civil Aviation, Montreal, 1981

Convention on Long-Range Transboundary Air Pollution (LRTAP), Geneva, 1979

United Nations Framework Convention on Climate Change (UNFCCC), New York, 1992

Vienna Convention for the Protection of the Ozone Layer, Vienna, 1985 including the Montreal Protocol on Substances that Depleted the Ozone Layer, Montreal, 1987

Accords Regarding Hazardous Substances

Convention on the Ban of the Import into Africa and the Control of Transboundary Movements and Management of Hazardous Wastes within Africa, Bamako, 1991

Convention on Civil Liability for Damage Caused during Carriage of Dangerous Goods by Road, Rail and Inland Navigation Vessels (CRTD), Geneva, 1989

Convention on the Control of Transboundary Movements of Hazardous Wastes and their Disposal (Basel Convention), Basel, 1989

Convention on the Transboundary Effects of Industrial Accidents, Helsinki, 1992

Convention to Ban the Importation into Forum Island Countries of Hazardous and Radioactive Wastes and to Control the Transboundary Movement and Management of Hazardous Wastes within the South Pacific Region (Waigani Convention), Waigani, 1995

European Agreement Concerning the International Carriage of Dangerous Goods by Road (ADR), Geneva 1957

FAO International Code of Conduct on the Distribution and Use of Pesticides, Rome, 1985

2. Major International Marine Accords:

Global Conventions

Convention on the Prevention of Marine Pollution by Dumping of Wastes and Other Matter (London Convention 1972), London, 1972

International Convention for the Prevention of Pollution from Ships, 1973, as modified by Protocol of 1978 relation thereto (MARPOL 73/78), London, 1973 and 1978

International Convention on Civil Liability for Oil Pollution Damage 1969 (1969 CLC), Brussels, 1969, 1976, and 1984

International Convention on the Establishment of an International Fund for Compensation for Oil Pollution Damage 1971 (1971 Fund Convention), Brussels, 1971

Convention on Liability and Compensation for Damage in Connection with the Carriage of Hazardous and Noxious Substances by Sea (HNS), London 1996

International Convention on Oil Pollution Preparedness, Response, and Co-operation (OPRC), London, 1990

International Convention Relation to Intervention on the High Seas in Cases of Oil Pollution Casualties (Intervention Convention), Brussels, 1969

United Nations Convention on the Law of the Sea (UNCLOS), Montego Bay, 1982

Regional Conventions

Convention for the Prevention of Marine Pollution by Dumping from Ships and Aircraft (Oslo Convention), Oslo, 1972

Convention for the Prevention of Marine Pollution from Land-based Sources (Paris Convention), Paris, 1974

Convention for the Protection of the Marine Environment of the North East Atlantic (OSPAR Convention), Paris, 1992

Convention for the Protection of the Marine Environment of the Baltic Sea Area (1974 Helsinki Convention), Helsinki 1974

Convention for the Protection of the Marine Environment of the Baltic Sea Area (1992 Helsinki Convention), Helsinki 1992

Conventions within the UNEP Regional Seas Programme

Convention on the Protection of the Black Sea against Pollution, Bucharest, 1992

Convention for the Protection and Development of the Marine Environment of the Wider Caribbean Region, Cartagena de Indias, 1983

Convention for the Protection, Management, and Development of the Marine and Coastal Environment of the Eastern African Region, Nairobi, 1985

Kuwait Regional Convention for Co-operation on the Protection of the Marine Environment from Pollution, [Kuwait](#), 1978

Convention for the Protection and Development of the Marine Environment and Coastal Region of the Mediterranean Sea (Barcelona Convention), Barcelona, 1976

Regional Convention for the Conservation of the Red Sea and Gulf of Aden Environment, Jeddah, 1982

Convention for the Protection of the Natural Resources and Environment of the South Pacific Region, Noumea, 1986

Convention for the Protection of the Marine Environment and Coastal Area of the South-East Pacific, Lima, 1981

Convention for Co-operation in the Protection and Development of the Marine and Coastal Environment of the West and Central African Region, Abidjan, 1981

3. Major Conventions Regarding Living Resources:

Marine Living Resources

Convention on the Conservation of Antarctic Marine Living Resources (CCAMLR), Canberra, 1980

International Convention for the Conservation of Atlantic Tunas (ICCAT), Rio de Janeiro, 1966

International Convention for the Regulation of Whaling (ICRW), Washington, 1946

Nature Conservation and Terrestrial Living Resources

Antarctic Treaty, Washington, D.C., 1959

Convention Concerning the Protection of the World Cultural and Natural Heritage (World Heritage Convention), Paris, 1972

Convention on Biological Diversity (CBD), Nairobi, 1992

Convention on the Conservation of Migratory Species of Wild Animals (CMS), Bonn, 1979

Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES), Washington, D.C., 1973

Convention on Wetlands of International Importance especially as Waterfowl Habitat (Ramsar Convention), Ramsar, 1971

Convention to Combat Desertification (CCD), Paris 1994

FAO International Undertaking on Plant Genetic Resources, Rome, 1983

International Tropical Timber Agreement, 1994 (ITTA, 1994), Geneva, 1994

Freshwater Resources

Convention on the Protection and Use of Transboundary Watercourses and International Lakes, Helsinki, 1992

4. Major Conventions Regarding Nuclear Safety:

Convention on Assistance in the Case of a Nuclear Accident or Radiological Emergency (Assistance Convention), Vienna, 1986

Convention on Early Notification of a Nuclear Accident (Notification Convention), Vienna, 1986

Convention on Nuclear Safety, Vienna, 1994

Vienna Convention on Civil Liability for Nuclear Damage, Vienna, 1963

5. Major Intergovernmental Organizations

Commission on Sustainable Development (CSD)

European Union (EU): Environment

Food and Agriculture Organization (FAO)

Global Environment Facility (GEF)

International Atomic Energy Agency (IAEA)

International Council for the Exploration of the Sea (ICES)

International Fund for Agricultural Development (IFAD)

International Labour Organization (ILO)

International Maritime Organization (IMO)

International Monetary Fund (IMF)

International Oil Pollution Compensation Funds (IOPC Funds)

Organization for Economic Co-operation and Development (OECD), Environment Policy Committee (EPOC)

United Nations Children's Fund (UNICEF)

United Nations Development Programme (UNDP)

United Nations Educational, Scientific, and Cultural Organization (UNESCO)

United Nations Environment Programme (UNEP)

United Nations Industrial Development Organization (UNIDO)

United Nations Population Fund (UNFPA)

World Bank

World Food Programme (WFP)

World Health Organization (WHO)

World Meteorological Organization (WMO)

World Trade Organization (WTO)

6. Major Non-Governmental Organizations

Atmosphere Action Network East Asia (AANE)

Climate Action Network (CAN)

Consumers International (CI)

Earth Council

Earthwatch Institute

Environmental Liaison Centre International (ELCI)

European Environmental Bureau (EEB)

Forest Stewardship Council (FSC)

Friends of the Earth International (FoEI)

Greenpeace International

International Chamber of Commerce (ICC)

International Confederation of Free Trade Unions (ICFTU)

International Planned Parenthood Federation (IPPF)

International Solar Energy Society (ISES)

IUCN-The World Conservation Union

Pesticide Action Network (PAN)

Sierra Club

Society for International Development (SID)

Third World Network (TWN)

Water Environment Federation (WEF)

Women's Environment and Development Organization (WEDO)

World Business Council for Sustainable Development (WBCSD)

World Federalist Movement (WFM)

World Resources Institute (WRI)

World Wide Fund For Nature (WWF)

7. Other Networking Instruments

Arab Network for Environment and Development (RAED)

Global Legislators for a Balanced Environment (GLOBE)

Regional Environmental Center for Central and Eastern Europe (REC)

United Nations Non-Governmental Liaison Service (UN-NGLS)

Note on Edition Dates:

The earlier edition dates are noted above because they were used to formulate the original country reviews and serve as the baseline for some of the information covered. Later editions have been used in some cases, and are cited as such, while other more recent online resources (cited above) contain recent and ever-updated data sets used for research.

Methodology Notes for Economic Data:

Estimates by CountryWatch.com of GDP in dollars in most countries are made by converting local currency GDP data from the International Monetary Fund World Economic Outlook to US dollars by market exchange rates estimated from the International Monetary Fund International Financial Statistics and projected out by the CountryWatch Macroeconomic Forecast. Real GDP was estimated by deflating current dollar values by the US GDP Implicit Price Deflator.

Exceptions to this method were used for:

- Bosnia-Herzegovina
- Nauru
- Cuba
- Palau
- Holy See
- San Marino
- Korea, North
- [Serbia](#) & Montenegro
- Liberia
- Somalia
- Liechtenstein
- Tonga
- Monaco
- Tuvalu

In these cases, other data and/or estimates by CountryWatch.com were utilized.

Methodology Notes for the HDI:

Since 1990, the United Nations Development Programme, in concert with organizations across the globe, has produced the [Human Development Index](#) (or HDI). According to the UNDP, the index measures average achievement in basic human development in one simple composite index, and produces from this index a ranking of countries. The HDI is a composite of three basic components of human development: longevity, knowledge and standard of living. Longevity is measured by life expectancy. Knowledge is measured by combination of adult literacy and mean

years of schooling. Standard of living is measured by purchasing power, based on real GDP per capita (in constant US\$) adjusted for differences in international living costs (or, purchasing power parity, PPP). While the index uses these social indicators to measure national performance with regard to human welfare and development, not all countries provide the same level of information for each component needed to compute the index; therefore, as in any composite indicator, the final index is predicated on projections, predictions and weighting schemes. The index is a static measure, and thus, an incomplete measure of human welfare. In fact, the UNDP says itself the concept of human development focuses on the ends rather than the means of development and progress, examining in this manner, the average condition of all people in a given country.

Specifically, the index is calculated by determining the maximum and minimum for each of the three components (as listed above) and then measuring where each country stands in relation to these scales-expressed as a value between 0 and 1. For example, the minimum adult literary rate is zero percent, the maximum is 100 percent, and the reading skills component of knowledge in the HDI for a country where the literacy rate is 75 percent would be 0.75. The scores of all indicators are then averaged into the overall index.

For a more extensive examination of human development, as well as the ranking tables for each participating country, please visit: <http://www.undp.org>
